Save91 / SaveMore

Working name, to be finalised

What one saver is worth

The answer to "by just cross-selling, what are our 5-year and 8-year LTVs?", on the founders' inputs of 24 October.

October 2026 · Confidential · 9 pages

CROSS-SELLING ALONE (LOANS AND CARDS), PER SAVER

₹143 in 5 years · ₹173 in 8

That is 0.29× and 0.35× of the ₹495 it costs to win a saver, before serving, and less than the ₹190 / ₹225 it costs to serve them, so on its own it never pays back (−0.10× after serving). Insurance, recharge, bills, FD and NPS are not counted.

WITH FUND FEES, AFTER SERVING (LTV/CAC)

0.75× in 5 years · 1.32× in 8

Pays back in month 75. LTV/CAC: what a saver brings in over 5 or 8 years, less the cost of serving them, divided by what it costs to win them.

TWO INPUTS STILL TO CONFIRM IN WRITING

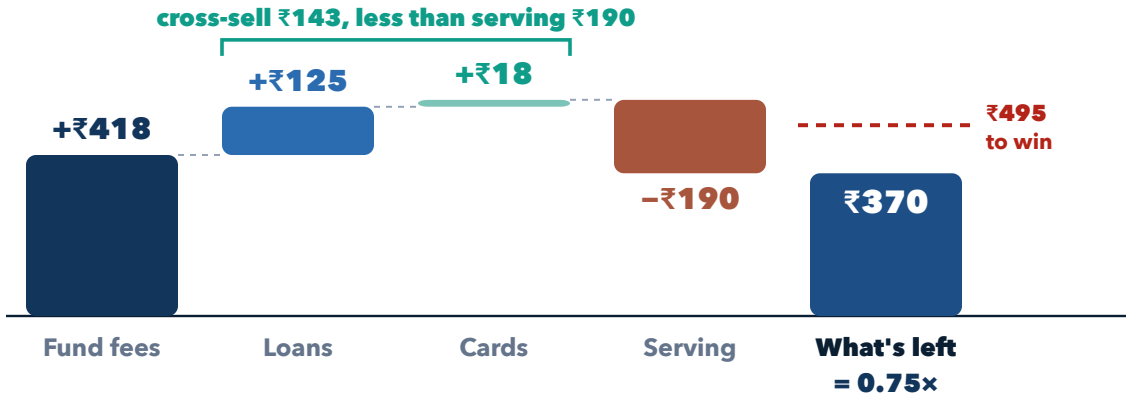

Assumes debits cost us ₹0 and a 0.75% equity fund fee, both still to be confirmed in writing: ₹2 a weekly debit would cut a saver to about 0.39×, a 0.5% fee to about 0.49×.

Cost to win: ₹450 at scale (the founders' figure; they call it 'fairly sorted') plus the 10% contingency = ₹495. The seed budgets ₹600 while the brand is new, and measures it. Funds are bought in the saver's own name; the app never holds money.

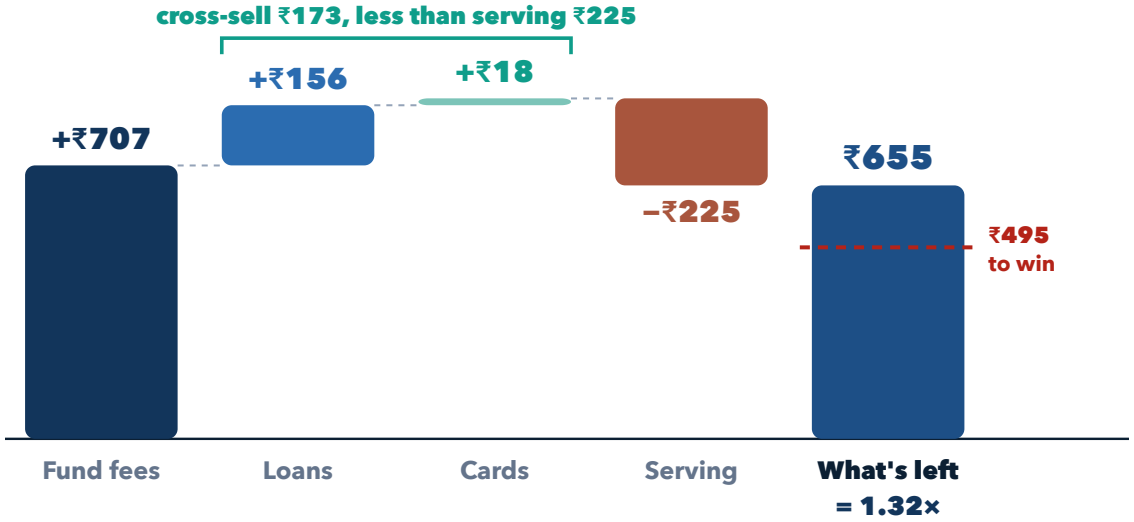

WHERE ONE SAVER'S VALUE COMES FROM

Fund fees bring 74% of a saver's revenue in 5 years; cross-selling brings ₹143, less than the ₹190 it costs to serve the saver

FIRST 5 YEARS (₹ PER SAVER WON)

FIRST 8 YEARS

Fund fees: 0.64% a year of the balance

80% in equity funds at 0.75%, 20% in a debt fund at ~0.22%, paid while the saver keeps saving. A saver who stops takes the balance, so the fees stop.

Loans: about 11 per 100 savers in 5 years

One-off lender fees: ₹70k first loans at 2%; 20% of the users we can reach apply a year and 20% of first loans are approved (gold 70%, home and property 45%).

Serving: ₹190 in 5 years

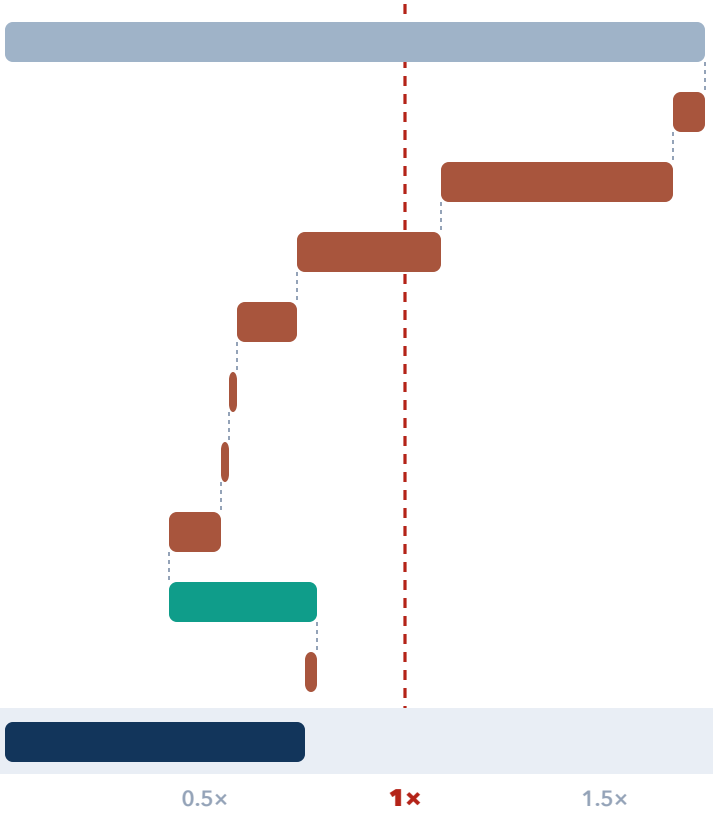

₹5 of support a month per saver still saving and ₹4 of tech for each of the 1.06 people reached, plus the 10% contingency. Debits ₹0 (to confirm).

One online saver won, the main case, undiscounted. Loans count the KYC'd sign-ups who came with the saver (KYC'd: finished the identity check). Cards: 3% of savers still saving at month 7 take one. Cost to win: ₹450 + 10% = ₹495; at ₹600 (₹660 with the contingency) a saver is about 0.56× / 0.99× and the company needs $12.0M+.

THE BRIDGE

From the 23 October 1.75× to 0.75× today

EACH DECISION, ONE AT A TIME	LTV/CAC, 5 YEARS	CHANGE	5 YEARS	8 YEARS
23 October main case			**1.75×**	2.75×
Serving carries the 10% contingency (a correction) as the cost to win and the company model already did		**−0.08**	**1.67×**	2.66×
Personal and business loans ₹70k, not ₹1.7 lakh Bachatt's figure for a first loan; repeats 10% bigger a year repaid, plus top-ups		**−0.58**	**1.09×**	1.86×
Apply and approval at today's market, no yearly rises 20% of the users we can reach apply a year (was 27%); 20% of first loans approved (was 25%)		**−0.36**	**0.73×**	1.37×
Home ₹12 lakh and property ₹5 lakh market sizes; they were ₹20.6 lakh and ₹14.6 lakh		**−0.15**	**0.58×**	1.19×
Lender payout 2% flat the market's middle; it was rising 24% by year 5		**−0.02**	**0.56×**	1.15×
Sign-ups who never save fade within ~3 months they now count as 1.06 people per saver in value, not 1.72		**−0.02**	**0.54×**	1.12×
Recharge, bills, FD and NPS off not in the launch app		**−0.13**	**0.41×**	0.93×
Debits at ₹0 to us to confirm through BSE StAR MF or the fund house's mandate		**+0.37**	**0.78×**	1.37×
Still saving at 12 months: Bachatt's 30–40% the median, 35%, with the debt fund's fee and repeat approval at the Monte Carlo median		**−0.03**	**0.75×**	1.32×
Today's main case (24 October)			**0.75×**	**1.32×**

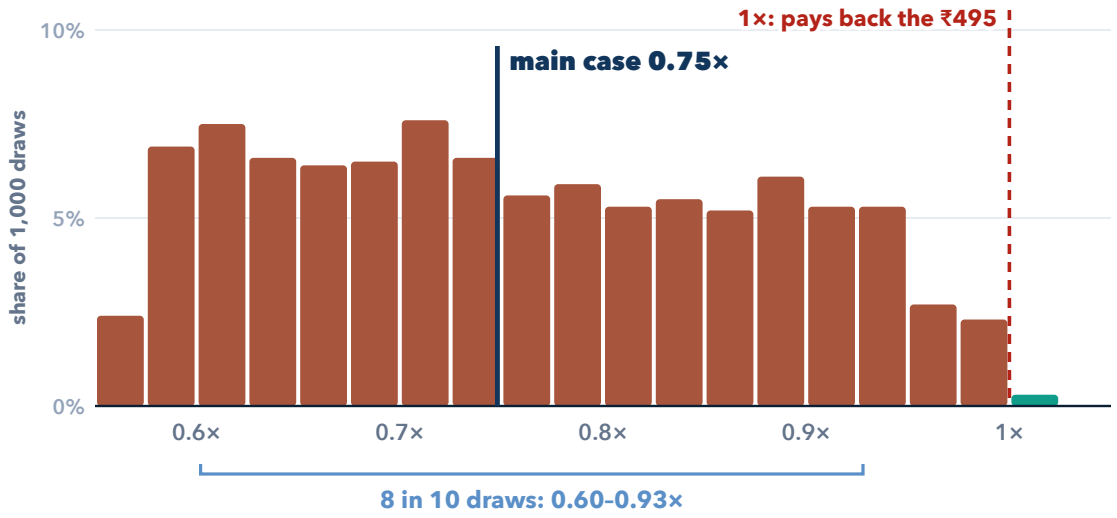

The ₹70k loan and market apply and approval rates took 0.94×; moving debits to ₹0 won back 0.37×, and that one is still to be confirmed in writing.

Each row applies one decision on top of the rows above it, so the order changes the size of a step but not where it ends. Changes are between the rounded values, so they add up. One online saver; cost to win ₹495 throughout; undiscounted.

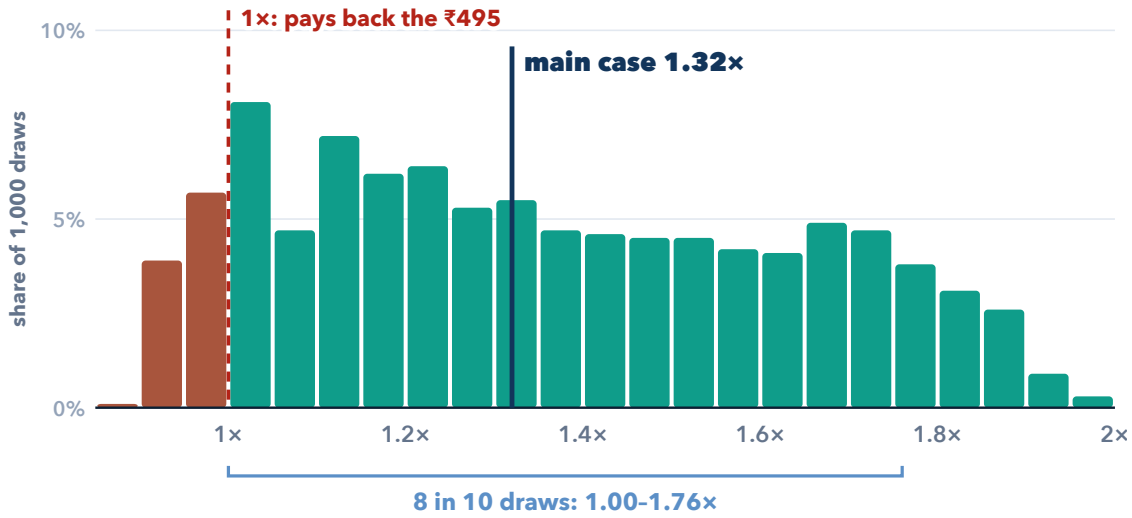

WHAT'S UNCERTAIN

What's still uncertain is mostly how long savers keep saving: 0.60–0.93× at 5 years, 1.00–1.76× at 8 (8 in 10 draws)

AFTER 5 YEARS — **0.3% of the draws reach 1×**

AFTER 8 YEARS — **90% reach 1×**

Two inputs are still uncertain

Still saving at 12 months (Bachatt's 30–40%) and the debt fund's fee (0.10–0.35%). Everything else is fixed by the founders: market figures, Bachatt, or our judgement.

Retention decides it

At 30% still saving the median is 0.57×; at 40%, 0.98×. The debt fund's fee moves it only from 0.72× to 0.79×. In 8 in 10 draws a saver pays back from month 64 to not by month 96.

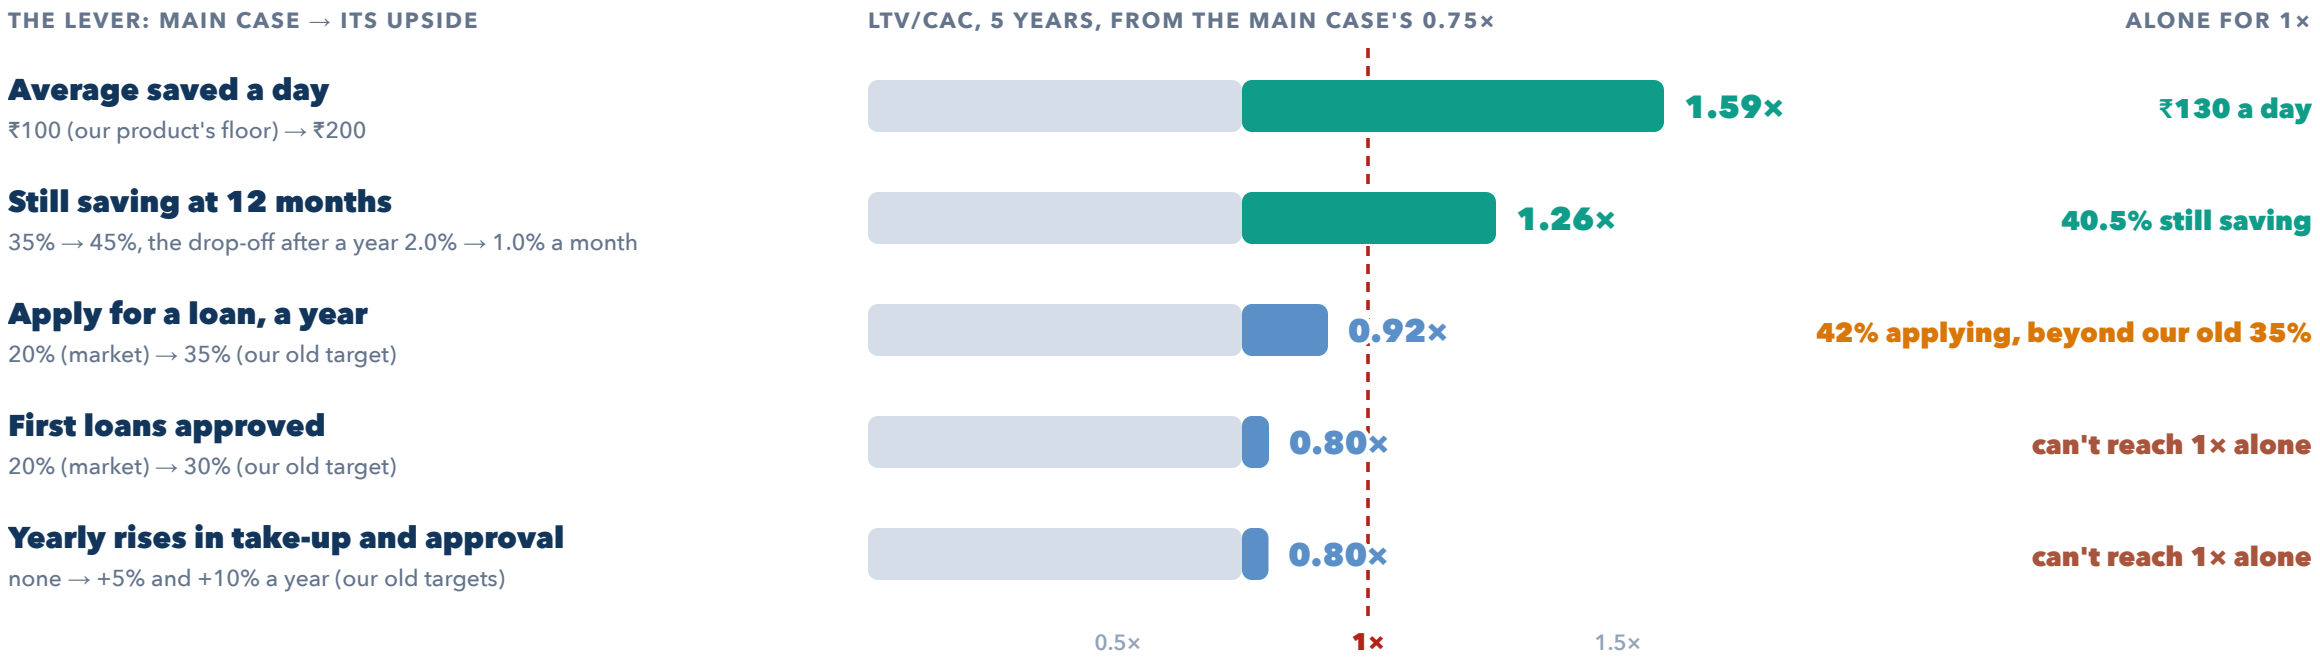

The company, in every draw

EBITDA is not positive by month 96 in any of the 1,000 draws. 8 in 10 draws need $8.8M+ to $9.8M+: the company is still losing money at month 96.

The Monte Carlo: we ran the model 1,000 times, picking retention and the debt fund's fee at random within their ranges. 0.3% of the 1,000 draws reach 1× in 5 years, holding everything else at the main case (cost to win ₹495). The main case is the median draw; 8 in 10 draws fall between the 10th and 90th percentiles. Undiscounted.

WHAT IT TAKES: ONE LEVER AT A TIME

What it takes, one lever at a time: ₹130 a day or 40.5% still saving takes a saver to 1×; no loan number does on its own

A bigger daily amount
Fund fees are paid on the balance, so the daily amount moves LTV/CAC most: ₹130 a day pays back the ₹495 in 5 years; ₹200 gives 1.59×.

Longer saving
40.5% still saving at 12 months gives 1× on its own; 45%, the credit hook we hope for (with 1.0% a month stopping after), 1.26×.

What cross-selling can do
No single loan number reaches 1×. All three at our old targets together give about 1.12× and bring profit in month 85: loan fees arrive early, fund fees build slowly.

Each row: one lever at its upside, everything else at the main case. Upside: ₹200 a day; 45% still saving; our old loan targets (applying 35%, approval 30%, take-up +5% and approval +10% a year). Alone for 1×: the value that lever needs on its own for a 5-year LTV/CAC of 1× (cost to win ₹495). Our old loan targets together: the company needs $6.0M.

WHAT IT TAKES: THE COMPANY AT EACH LTV/CAC

What it takes: 2× needs ₹161 a day and 41% still saving, with loans most of the way to our old targets, for profit from month 68; 3× needs ₹194 a day and 44%

LTV/CAC, 5 YEARS	₹ A DAY	STILL SAVING	APPLY A YEAR	APPROVED	YEARLY RISES	8 YEARS	EBITDA POSITIVE	MONEY NEEDED
0.75× 0.57–0.98× at 30–40% still saving	₹100	35% (30–40%)	20%	20%	none	1.32×	not by month 96 $8.7M+ to $9.9M+ at 40–30%	$9.3M+
1.00×	₹115	36%	22%	22%	+0.8% / +1.5%	1.79×	not by month 96	$8.1M+
2.00×	₹161	41%	29%	26%	+3.1% / +6.1%	3.79×	month 68	$5.1M
3.00×	₹194	44%	34%	29%	+4.7% / +9.4%	5.99×	month 55	$4.0M

One company, one main case

Every row is the same company: 20,000 online savers a month from month 30, the same team and cost to win. The rows say what would have to be true, not a second plan.

Five levers move together

From the main case towards the upside: ₹100 → ₹200 a day, still saving → 45%, applying 20% → 35%, approval 20% → 30%, yearly rises none → +5% / +10%. Teal: a lever above the main case.

Every lever at its upside

3.20×: the company turns positive in month 54 on $3.9M.

Band: the main case with still saving anywhere in Bachatt's 30–40%, every other input held. EBITDA: operating profit before interest, tax and depreciation. Money needed = the seed + the deepest cash hole (fees arrive 2 months after they are earned) + a ₹5 crore cash buffer, at ₹95 = $1; + means the company is still losing money at month 96, so it needs at least this (if run on, the cash hole bottoms around year 12 at about $10.6M). Doorstep savers (1 in 10) carry the same levers. Undiscounted.

THE FOUR FACTS TO GET NEXT

Four facts decide most of the answer, and all four are cheap to get: two questions to Bachatt and two answers in writing

THE FACT, AND HOW CHEAPLY WE CAN GET IT

1 Bachatt's average daily amount

Ask Bachatt for the average, not the minimum. ₹100 is our product's floor; Bachatt's own minimums are lower (₹51/₹101 a day; ₹20 for its liquid fund).

Company: ₹200 a day gives profit from month 76 on $5.9M.

2 Bachatt's exact share still saving at 12 months

Ask Bachatt for its 12-month cohort curve; it has told us 30–40%.

40.5% alone gives 1×; 45% (1.0% a month stopping after) needs $7.8M.

3 Debits at ₹0 to us, in writing

BSE StAR MF and the fund houses: a daily ₹100 debit on one mandate, at no cost to us.

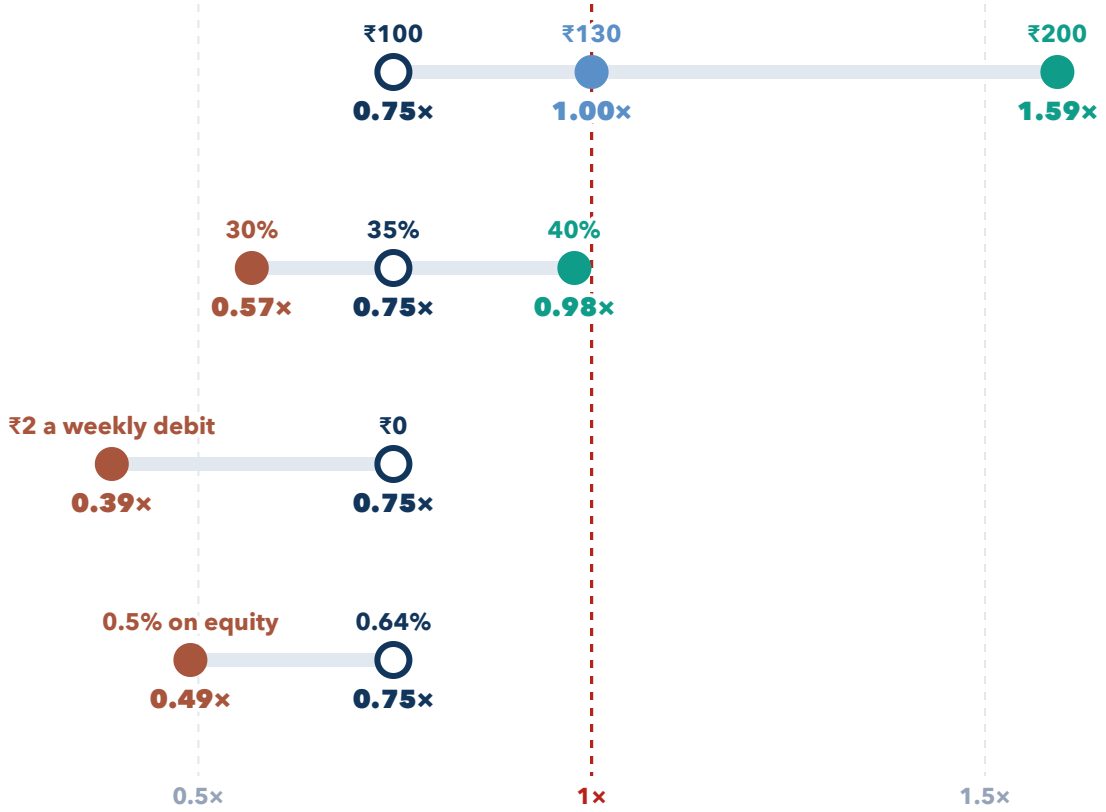

Company: paying ₹2 a weekly debit raises the money needed to $11.7M+.

4 The fee on the fund the ₹100 goes into, in writing

0.64% blended or better: 80% equity at 0.75%, 20% debt at ~0.22%. Daily minimums are ~₹100 a scheme, so one hybrid fund must pay about 0.64% or more.

Company: at 0.5% on equity the money needed is $10.6M+.

ONE SAVER'S LTV/CAC, 5 YEARS, EITHER WAY

Open circle: the main case (0.75×). Retention: the Monte Carlo median with still saving pinned at 30%, then 40%. The other rows change one input at a time from the main case. None of the four needs the seed's money: two data requests and two confirmations in writing.

A1 · EVERY INPUT AND ITS SOURCE

The inputs: two are still uncertain and two still to be confirmed in writing; the founders fixed the rest

Saved a day
₹100 our floor
our product's floor; Bachatt's average is unknown, and its own minimums are lower (₹51/₹101 a day)

Still saving at 12 months
30–40% uncertain
Bachatt's own range (main case 35%); the drop-off after a year moves with it, 2.5% to 1.5% a month

Equity fund fee to us
0.75% to confirm
a year of the balance, on active equity funds

Debt fund fee to us
0.10–0.35% uncertain
a liquid to a short-duration fund (main case 0.22%); 0.64% blended

Cost of a daily debit
₹0 to confirm
BSE's exchange SIP is free to distributors; fund houses pay BSE

First personal or business loan
₹70k Bachatt
Bachatt's number (our research: ₹15k–58.5k); repeats 10% bigger a year, plus top-ups

Apply for a loan, a year
20% market
of the users we can reach

First loans approved
20% market
between 11% (an app lender's new applicants) and 25% (our past data); gold 70%, home and property 45%

Yearly rises in take-up, approval
none market
no source found for any rise

Home / property loan size
₹12 / ₹5 lakh market
affordable home loans ₹6–15 lakh; small property loans ~₹3.9 lakh

Lender payout, personal or business
2% flat market
the middle of the market's 1–3%

People reached per saver (value)
1.06 market
about 2.5 KYC'd people come with each saver, but non-savers fade within ~3 months

Recharge, bills, FD, NPS
off off for now
not in the launch app; upside once built

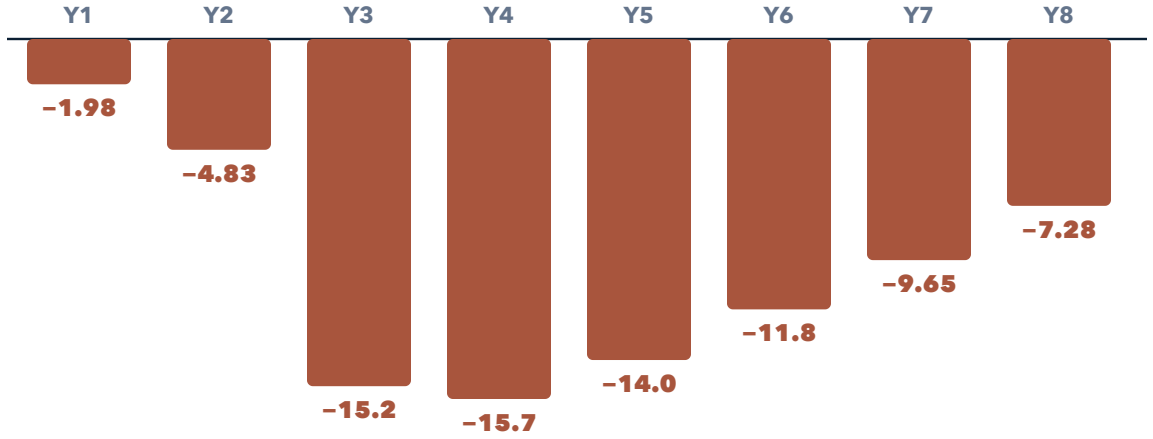

Cost to win a saver
₹495 founders' figure
₹450 at scale + our 10% contingency; the seed budgets ₹600 and measures it

Also fixed: fund mix 80% equity, 20% debt; 80% still saving at month 3; 70% of repeat loans approved; loans over 18 months; top-ups 15% a year at 40% of the loan. Small loans outside the apply funnel: durables (₹20k) and two-wheelers. Not counted: loans against savings (10% of applications), insurance (a fixed referral fee, to be agreed). SIP: a regular instalment into a mutual fund; mandate: the saver's standing instruction to their bank to pay the daily amount.

A2 · THE COMPANY AT THE MAIN CASE

At the main case the company does not turn profitable within 8 years: a saver earns back less than it costs in 5 years, so growing faster deepens the loss

EBITDA (OPERATING PROFIT) BY YEAR, ₹ CRORE

CUMULATIVE EBITDA AT EACH YEAR END

	Y1	Y2	Y3	Y4	Y5	Y6	Y7	Y8
Total	−1.98	−6.81	−22.0	−37.7	−51.7	−63.5	−73.1	−80.4

Not by month 96

EBITDA is still −₹7.28 Cr in year 8: the company does not turn profitable within 8 years.

At least $9.3M

money needed in all, seed included; still rising at month 96 (if run on, it bottoms around year 12 at about $10.6M).

−₹80 Cr

EBITDA added up over 8 years, undiscounted.

Why growing faster doesn't help

Each saver costs ₹495 and earns back ₹370 in 5 years, so more savers mean a deeper hole: 10k a month $6.2M+, 20k a month $9.3M+, 40k a month $15.9M+, 80k a month $29.0M+.

What would change it

₹200 a day: profit from month 76 on $5.9M. 2× (₹161 a day, 41% still saving, loans most of the way to our old targets): month 68 on $5.1M.

The shape

20,000 online savers a month from month 30 after the seed, 1 in 10 from the doorstep; ₹600 to win a saver in the seed, ₹450 after, plus our 10% contingency on every cost.

EBITDA: operating profit before interest, tax and depreciation. Money needed = the seed + the deepest cash hole (fees arrive 2 months after they are earned) + a ₹5 crore cash buffer, at ₹95 = $1; + means the company is still losing money at month 96, so it needs at least this (if run on, the cash hole bottoms around year 12 at about $10.6M). Undiscounted; tax on profit after losses carried forward.
