Working name, to be finalised

What one saver is worth

LTV/CAC, assumption by assumption: the number, where it comes from, how far it could be wrong, and what that does.

October 2026 · Confidential

7.7×

if our loan targets hold. One online saver: ₹495 to win (₹450 + our 10% contingency), ₹3,813 back over five years after serving; paid back in month 12

5.6×

one doorstep saver: ₹446 to win all-in, ₹2,477 back; paid back in month 18

5.2× median

across 1,000 simulated futures (our own ranges, not observed odds): 89% at 3× or better, 1 in 10 below 2.9×

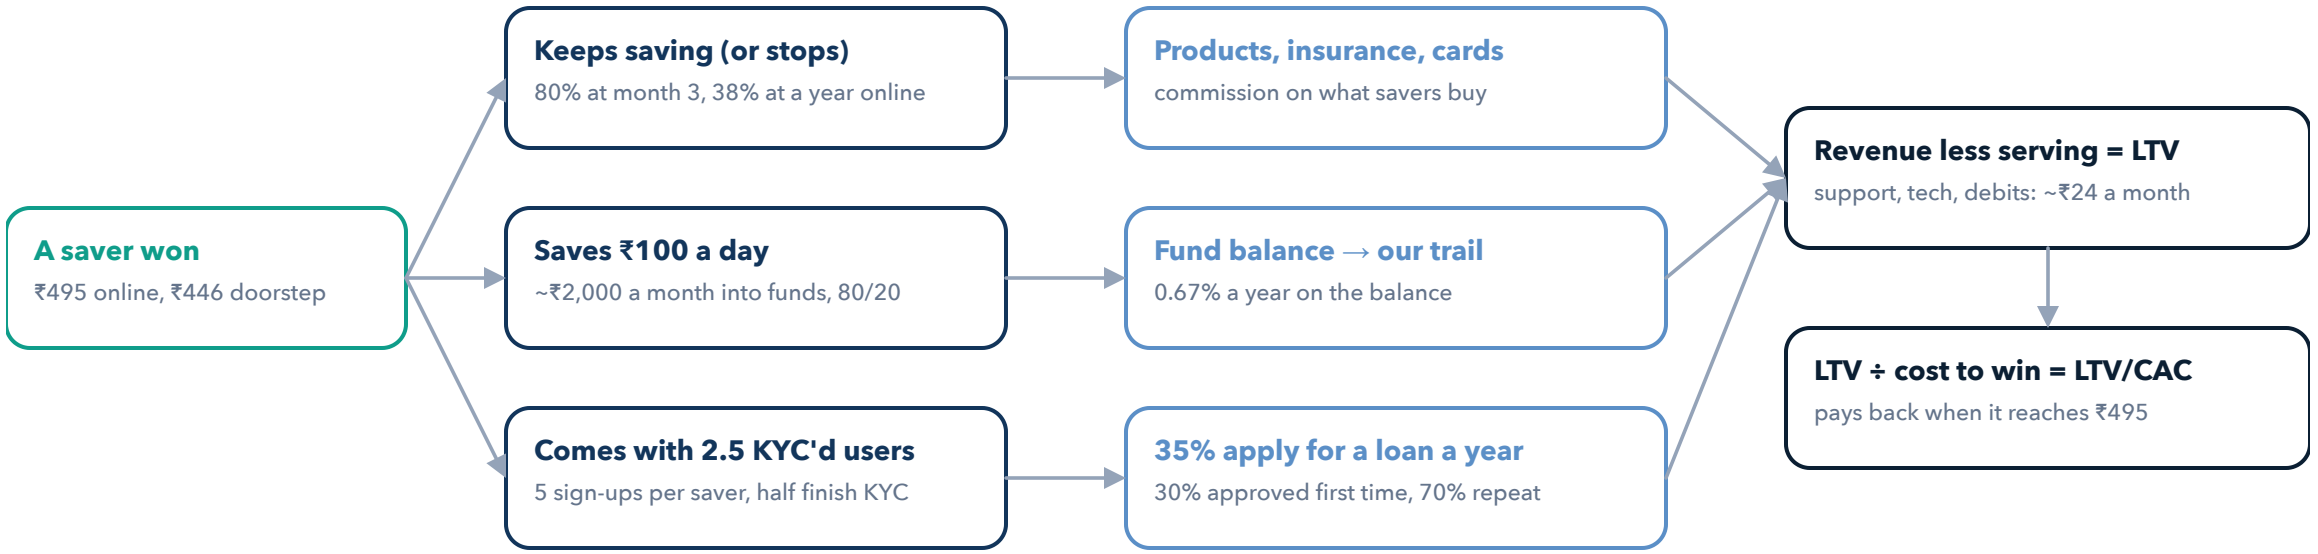

11 numbers

decide it: how many apply for a loan, loan size, the cost to win, the loan payout, loan approvals, how many see loan offers, how many keep saving, both: share who stop each month after month 12, the daily amount, take-up of every product rises each business year and approvals rise each business year (lenders see our repayments). The loan numbers are our targets; each is shown with its evidence, range and effect.

The same model as the business plan, rebuilt in a live workbook cell by cell. The arithmetic is checked to the rupee; the assumptions are ours. Change one in the workbook and the per-saver answer moves live; the 1,000 futures are rerun on request.

THE DEFINITION

One saver's value is three streams (the fund, loans, other products) for as long as they keep saving, less serving, against the cost to win them

Saver won, not sign-up

A saver is someone who starts saving. Online, 1 in 5 sign-ups does; the cost to win is everything spent to get one saver.

Undiscounted, 5 years (8 alongside)

LTV = what a saver brings in less what it costs to serve them while they save. No discounting: the cumulative rupees.

The cautious saver

The answer is for a saver who joins early, before take-up and approvals have grown with the business's track record (they grow to year 5), at the post-seed ₹450 to win (₹495 with our 10% contingency). Later savers are worth more.

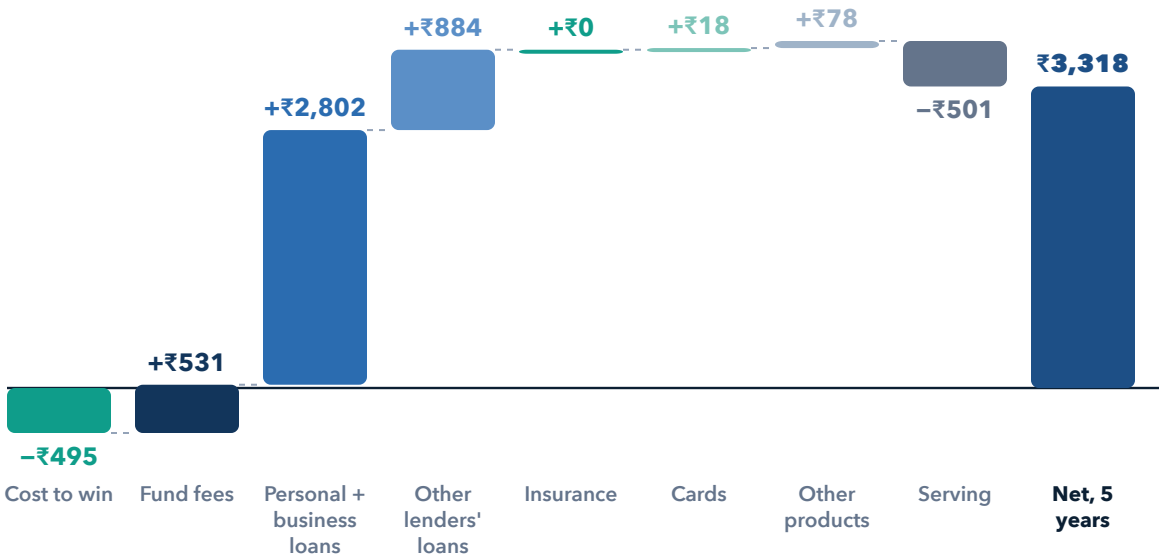

Words used here. KYC'd: finished the identity check. **Trail**: the yearly share of a fund's fee paid to its distributor. **SIP**: a regular instalment into a mutual fund. **NBFC**: a non-bank lender. **DSA**: an agent paid by a lender for referred loans. **EMI**: a loan instalment. **LAP**: a loan against property. **Doorstep**: a field agent signs the saver in person. **The seed**: the seed round, an 18-month plan plus 6 months to raise the next round. **Futures**: simulated draws of all inputs together.

Not in this view: the team, office and brand, the two-month wait for fees, tax. Fees are quoted before GST and TDS. The app never holds the money; loans are made by banks and NBFCs.

LTV / CAC

If our loan targets hold, an online saver costs ₹495 and returns ₹3,813 over five years: 7.7×, paid back in month 12; a doorstep saver 5.6×, month 18

ONE ONLINE SAVER WON, FIRST 5 YEARS (₹)

₹ PER SAVER WON	ONLINE, 5 YEARS	DOORSTEP, 5 YEARS	ONLINE, 8 YEARS	DOORSTEP, 8 YEARS
Cost to win	−₹495	−₹446	−₹495	−₹446
Fund fees	₹531	₹757	₹989	₹1,420
Personal + business	₹2,802	₹1,569	₹4,301	₹2,437
Other lenders	₹884	₹512	₹1,216	₹710
Insurance	₹0	₹0	₹0	₹0
Cards	₹18	₹21	₹18	₹21

Serving	−₹501	−₹492	−₹622	−₹623
Net	**₹3,318**	**₹2,031**	**₹5,525**	**₹3,687**
LTV/CAC	**7.70×**	**5.56×**	**12.16×**	**9.28×**
Pays back	month 12	month 18	–	–

Loans are the biggest stream

₹3,686 of ₹4,313: 85% of revenue. Fund fees are 12%; insurance, cards and other products 2%.

Doorstep: more saving, fewer loans

More doorstep savers keep saving (55% vs 38% at a year), so the fund earns ₹757 vs ₹531; but a doorstep saver brings no extra KYC'd users.

Cross-sell is 88% of revenue

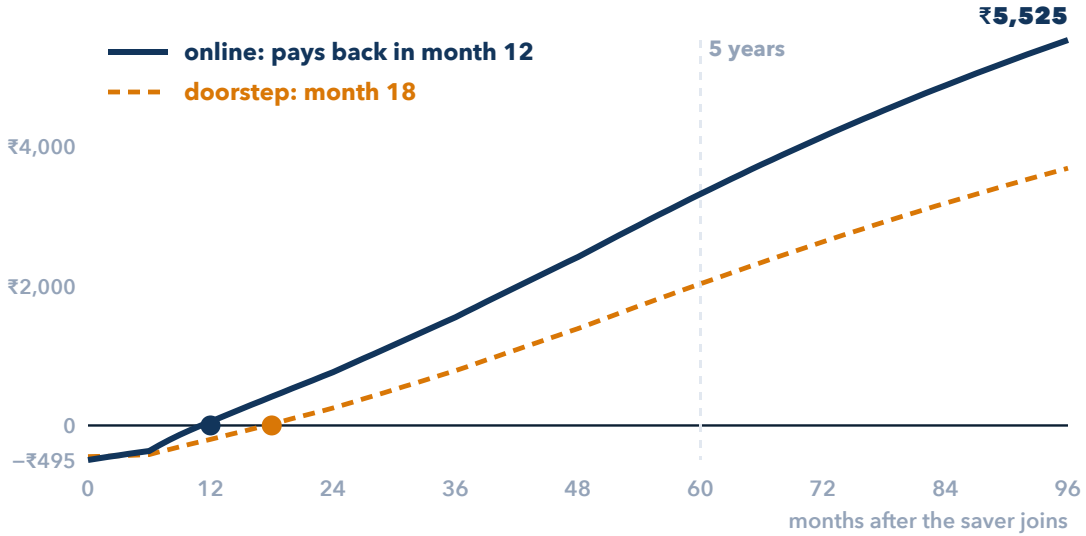

Everything except the fund trail is earned on what users borrow or buy through us. About ₹2,070 of the ₹3,813 comes from loans to KYC'd sign-ups who never save; with offers to savers only, LTV/CAC is 3.5×.

₹4,313 revenue − ₹501 serving = ₹3,813 returned; less ₹495 to win (₹450 + our 10% contingency) = ₹3,318 net. Live in the workbook, tab LTV-CAC. Rounded; rows may not add exactly.

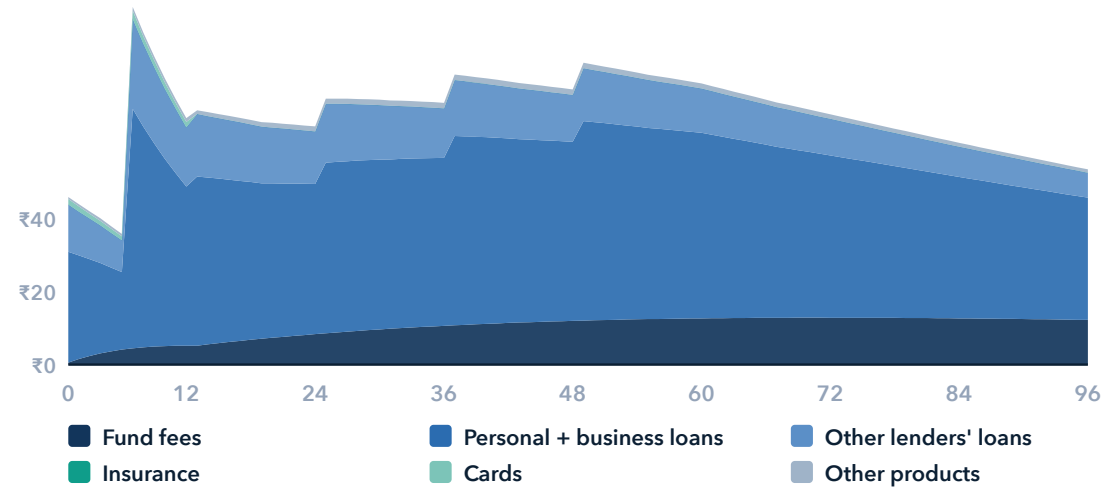

WHEN IT PAYS BACK

The online saver earns back the ₹495 in month 12; the doorstep saver in month 18; by year 8 they have returned 12.2 and 9.3 times their cost

CUMULATIVE ₹ PER SAVER WON, AFTER THE COST TO WIN

₹ A MONTH FROM ONE ONLINE SAVER WON, BY STREAM

Why month 12

Loans start in month 1 for every KYC'd user, at half the full take-up and 60% of the approvals for six months; a first loan pays 2% of ₹3 lakh. The fund trail builds slowly with the balance.

A jump in month 7

The first six months run at half the take-up and 60% of the approvals; from month 7 every user applies at the full rate, so first loans peak, then thin as users borrow once and savers stop.

Then a long tail

After year 1, 1.5% of savers stop each month; the fund balance, repeat borrowing and loan offers to KYC'd users who never saved keep paying: ₹2,207 more in years 6–8.

Left: cumulative revenue less serving, minus the cost to win (Saver tab, the last column of each saver). Right: the online saver's monthly revenue lines, stacked.

COST TO WIN A SAVER

We assume ₹450 to win an online saver after the seed, ₹495 with our 10% contingency; at ₹300 LTV/CAC is 11.6×, at ₹800 4.3×

THE SEED'S BUDGETED FUNNEL: WHAT A SAVER WON COSTS (₹)

5 sign-ups × ₹100
a sign-up, paid acquisition

₹500

1 in 5 sign-ups starts saving

2.5 KYCs × ₹40
half the sign-ups finish KYC

₹100

₹450 after the seed needs
₹70 a sign-up, or
1 in 3.75 saving

₹600 in the seed

ONLINE LTV/CAC AT ₹300 AND ₹800 TO WIN

Paid back in month **9** at ₹300 and month **18** at ₹800 (plan: month 12).
The doorstep cost is worked out, not assumed: agents' pay, kit, leads, offices and churn divided by the savers they sign, ₹405 a saver at scale (₹446 with our contingency).

ASSUMPTION	VALUE	RANGE WE TEST	WHERE IT COMES FROM
Online saver: cost to win after the…	**₹450**	₹300 – ₹800	Founder's judgement; seed funnel budget ₹600
Doorstep saver: cost to win, all-in…	**₹405**	fixed	Our business-plan model, at scale

₹450 after the seed
₹600 is the seed funnel's budget (₹100 a sign-up, 1 in 5 saving), not yet a measurement. ₹450 is the founder's judgement for after the seed, once the brand is known and referrals start.

₹300 is not our number
A competitor quoted about ₹300 per 'customer', without saying whether a customer is a sign-up or a saver. We use it only as the good end.

The seed will measure it
Cost per sign-up, share finishing KYC and share starting to save are the first three numbers we plan to report from the seed, every month.

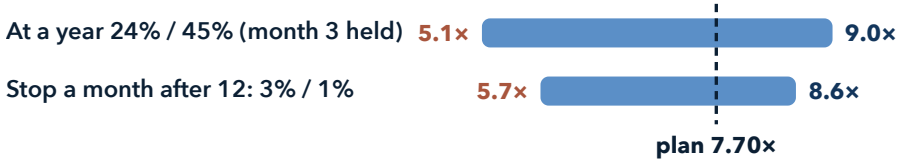

All-in: marketing, onboarding and KYC per saver won. Doorstep, at scale: agent salary, statutory costs, incentive and cash cover ₹26,000 a month; kit ₹12,000; 30% of agents leave a year.

WHO KEEPS SAVING

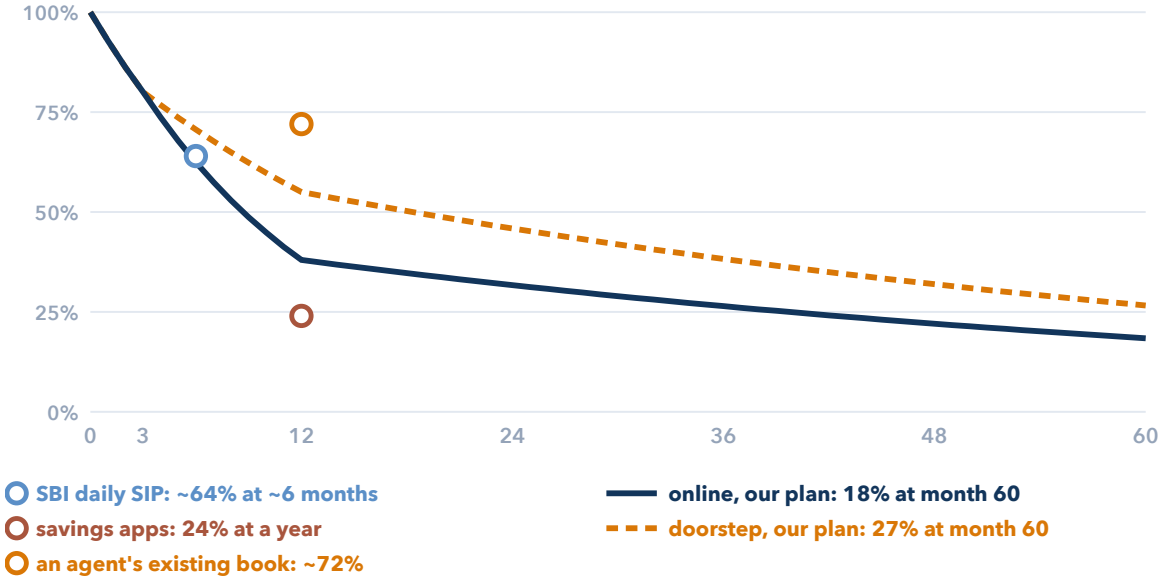

We assume 38 in 100 online savers are still saving after a year (doorstep 55); on the savings-app curve (24) LTV/CAC is 4.9×, at 45 it is 9.0×

ASSUMPTION	VALUE	RANGE WE TEST	WHERE IT COMES FROM
Online: still saving at month 3	**80%**	52% – 85%	SBI MF daily SIP's steady drop (NG-033)
Online: still saving at month 12	**38%**	24% – 45%	SBI MF ₹250 daily SIP, extended to 12 months
Doorstep: still saving at month 3	**80%**	60% – 92%	Agent's existing book ~92% (IV-12)
Doorstep: still saving at month 12	**55%**	25% – 72%	Agreed; agent's book ~72% (IV-01, IV-12)
Both: share who stop each month after…	**1.5%**	1% – 3%	US micro-investing app ~1% (TB-11)

ONLINE LTV/CAC AT EACH END

SHARE OF SAVERS WON STILL SAVING, MONTHS 0-60

Doorstep at 25% / 72% still saving at a year: **2.6×** / **7.2×** (plan 5.6×).

38% is an extrapolation

SBI MF's ₹250 daily SIP lost 36% of a year's sign-ups within that year, at an average age of about six months; we extend the same monthly drop to month 12. Nobody has observed our product yet.

Why the doorstep keeps more

An agent visits every few days; an existing agent's book keeps about 72% a year. We plan 55% for new doorstep savers, between an app and an existing book.

After a year, few leave

Savers who last a year rarely stop: a US micro-investing app loses about 1% a month after month 12; an agent's book about 2.7%. We plan 1.5%.

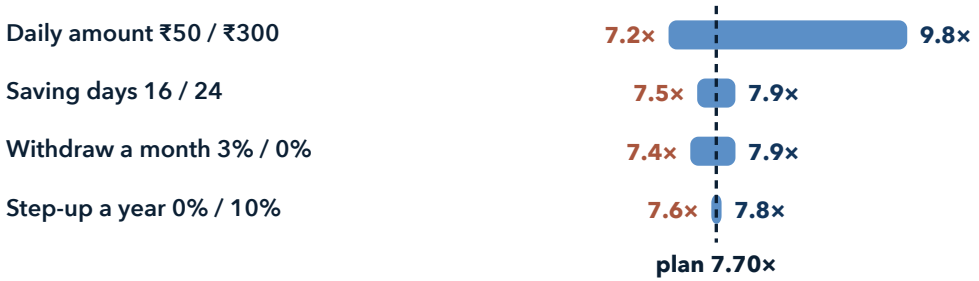

Monthly drop-off: steady within months 1–3 and within months 4–12 (so 80% at month 3 and 38% at month 12 online), then 1.5% a month for both.

HOW MUCH THEY SAVE

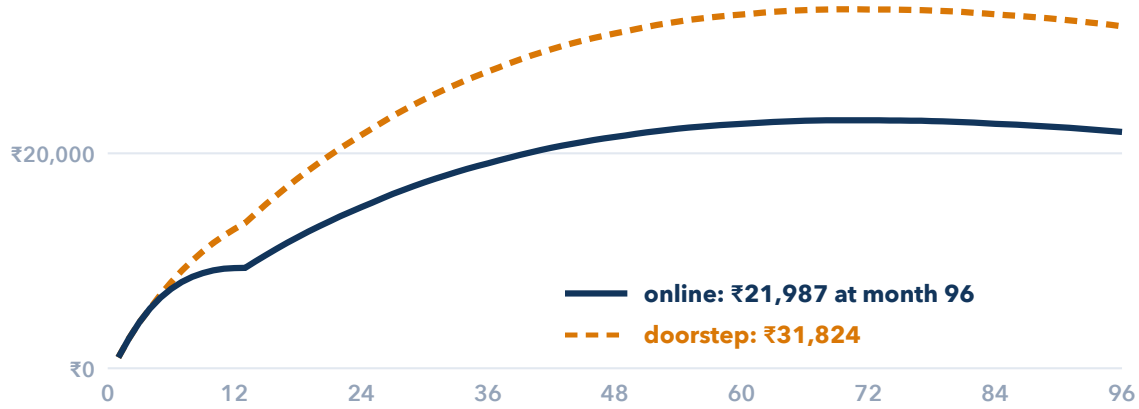

We assume ₹100 a day on about 20 days a month; at ₹50 LTV/CAC is 7.2×, at ₹300 it is 9.8×

ASSUMPTION	VALUE	RANGE WE TEST	WHERE IT COMES FROM
Daily amount	**₹100**	₹50 – ₹300	A daily-savings app's minimum
Saving days a month	**20**	16 – 24	Our judgement (a shop opens ~26 days)

Share of the balance withdrawn each…	**1%**	0% – 3%	Our judgement; no data
Share of the balance that stays at…	**100%**	fixed	Product design (an SIP runs on)

ONLINE LTV/CAC AT EACH END

FUND BALANCE PER SAVER WON (₹, AVERAGE IN THE MONTH)

₹100 a day: a typical starting amount

A leading daily-savings app's stated minimum is ₹100; daily SIPs start at ₹50; that app's own film shows ₹300. We test ₹50 to ₹300. On about 20 saving days, ₹100 is ₹2,000 a month.

₹45,411 saved in five years

per online saver won (counting those who stop). The balance earns our trail, so the daily amount moves LTV through the fund fees: 7.2× at ₹50, 9.8× at ₹300.

Money stays in

An SIP keeps running, so nothing is paid out at the year end; 1% of the balance is withdrawn each month for emergencies, and a saver who stops takes the balance.

Deposits step up 5% each year saved. Balance = last month's balance less withdrawals, plus this month's deposits, plus the fund's return on both.

THE FUND TRAIL

80% equity and 20% debt funds pay us 0.67% a year of the balance: ₹531 from an online saver over five years, 12% of revenue

ASSUMPTION	VALUE	RANGE WE TEST	WHERE IT COMES FROM
Equity share of the savings	**80%**	50% – 90%	Conversation with a daily-savings app
Equity fund return to the saver, net	**10%**	6% – 12%	Our estimate (conservative)
Debt fund return to the saver, net	**7%**	6% – 7.5%	Liquid funds 5–6% (OWN-02)
Our trail on equity funds	**0.75%**	0.5% – 0.9%	Listed distributor 0.88–0.91% (XO-08)
Our trail on debt funds	**0.35%**	0.2% – 0.5%	Fund guides 0.2–0.5% (XB-04)

ONLINE LTV/CAC AT EACH END

HOW THE FUND PAYS US

80% equity × 0.75% + 20% debt × 0.35%

trail commission, paid by the fund house on the balance

= 0.67% a year of the balance

₹531 over 5 years per online saver won

₹757 per doorstep saver (more keep saving)

Our own distributor licence (to be registered)

The one stream we plan to earn on our own registration. It is paid on the balance of savers still saving: we assume a saver who stops takes the money out, a cautious choice.

Equity trail ~0.75%

A listed distributor earns ~0.9% of assets, gross; we use 0.75%. Apps selling direct plans earn nothing.

Returns matter little

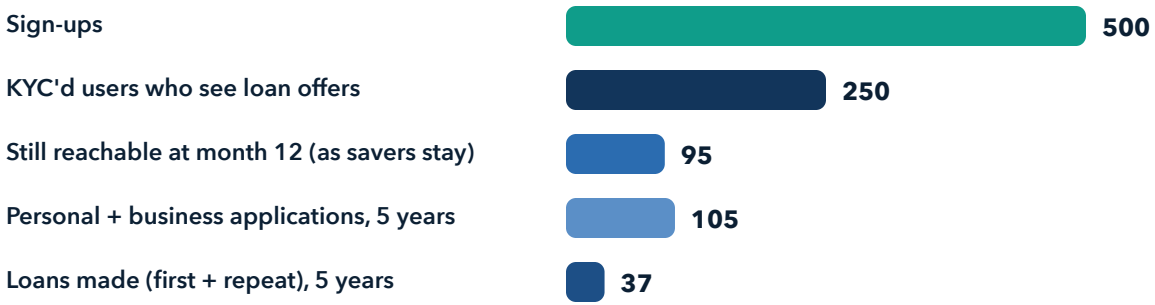

The fund's return only grows the balance the trail is paid on: 6% or 12% a year moves LTV/CAC by less than 0.1×.

Equity SIP trail 0.5–0.9% (a listed distributor's 0.88–0.91%); debt fund 0.2–0.5% (fund and adviser guides). Debt-only savers would earn the lower trail.

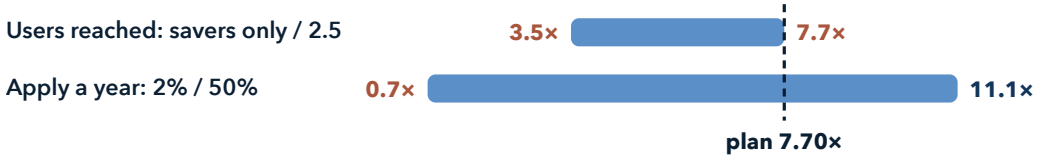

LOANS: WHO SEES THE OFFERS, WHO APPLIES

We assume loan offers reach 2.5 KYC'd users per online saver and 35% apply a year; offers to savers only give 3.5×, 2% applying gives 0.7×

PER 100 ONLINE SAVERS WON

ONLINE LTV/CAC AT EACH END

ASSUMPTION	VALUE	RANGE WE TEST	WHERE IT COMES FROM
Online: KYC'd users who see loan…	**2.5**	1 – 2.5	5 sign-ups a saver, half finish KYC
Reachable users who apply for a loan…	**35%**	2% – 50%	Founder's judgement; no observed rate
Share of applications: personal or…	**70%**	fixed	Founder's judgement (XF rows)
Share of applications: gold loans	**15%**	fixed	Founder's judgement (XF rows)
Share of applications: loans against…	**3%**	fixed	Founder's judgement (XF rows)
Share of applications: home loans	**2%**	fixed	Founder's judgement (XF rows)

Paid back in month **24** if offers go to savers only, month **71** if only 2% apply, month **9** if half do (plan: month 12).
The apply rate is the plan's most fragile number: across the 1,000 futures it moves LTV/CAC more than any other input (rank correlation 0.49). The nearest observed rate is 1–2% a year, among merchants on a payments app; at 2%, LTV/CAC would be **0.7×**, paid back in month **71**.
Only a user who opts in (a separate consent, under data-protection rules) can see offers and apply: the 35% counts all KYC'd users, so at least 35% must opt in, and saving improves the offer. The seed measures both. Rules on digital lending and on referral payouts could also change what lenders pay.

Anyone KYC'd who opts in

Every sign-up who finishes KYC and opts in sees loan offers from day 1, saver or not: up to 2.5 per saver won. One who never saves stays reachable as long as savers do.

35% apply a year

The founders' judgement for a credit-hungry segment; about half of fintech borrowers take a new loan within six months. Payments-app merchants: 1–2% a year.

Split by loan type

70% personal or business, 15% gold (70% of them approved: secured), 3% against property, 2% home; the 10% against the saver's own savings is not counted.

Doorstep savers: 1 user reached per saver won. Applications use the same monthly chance for every reachable user while they remain.

PERSONAL AND BUSINESS LOANS

Personal and business loans bring ₹2,802 per online saver: 38 loans per 100 savers won over five years, at a 2% payout on ₹3 lakh

PER 100 ONLINE SAVERS WON, FIRST 5 YEARS

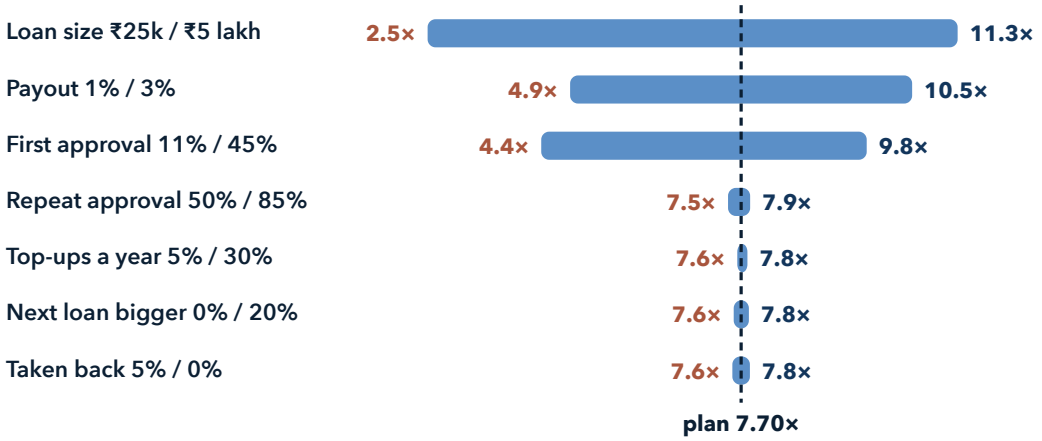

32 first loans **+ 5 repeat loans** **+ 1 top-up = 38**

about ₹115 lakh lent by banks and NBFCs

× 2% payout rising to 3% by month 60, less 2.5% of payouts taken back

= ₹2,802 per saver won 65% of 5-year revenue

ONLINE LTV/CAC AT EACH END

ASSUMPTION	VALUE	RANGE WE TEST	WHERE IT COMES FROM
First applications a lender approves	**30%**	11% – 45%	Founders' past data ~25% (XF-24)
Repeat applications approved (after…	**70%**	50% – 85%	Listed lender: 74% of repeat (XL-41)

Our DSA payout at the start	**2%**	1% – 3%	DSA rate cards 1–2.5% (XF-01)
Loan tenure	**18**	fixed	Research: 12-24 months
Borrowers with 12+ EMIs paid who take…	**15%**	5% – 30%	Our judgement; lenders top up good payers

30% first, 70% repeat

A digital lender approves 11% of new and 74% of repeat applicants; the founders' past lending about 25%. Our 30% sits above both; it rises 10% a year (cap 80%).

₹3 lakh, blended: the founders' number

Research found smaller loans: digital personal loans average ₹19,000–70,000; merchant loans ₹50,000–5 lakh (one app's average ₹2 lakh); the founders' own 2019–22 book ₹10–25k. At ₹25k LTV/CAC is 2.5×.

A DSA's payout

Platforms pay DSAs 1–2.5% of a personal loan, up to 3%; we start at 2%, rising to 3% by year 5. Paid by the lender, who takes back 2.5% of payouts (loans cancelled or repaid early).

Tenure 18 months; repeat loans once repaid; top-ups after 12 EMIs. We earn a referral payout only and the lender carries the credit risk. From the first loan we are each lender's lending service provider under RBI's digital-lending rules: fees from the lender only, a key-facts statement for every loan, a grievance officer.

OTHER LENDERS' LOANS

Gold, property, home, durable and vehicle loans from other lenders add ₹884 per online saver; loans against property bring 63% of it

LOAN	LOANS A YEAR (SHARE)	APPROVAL	LOAN SIZE	OUR FEE	LOANS PER 100 SAVERS, 5 Y	₹ PER SAVER WON, 5 Y
Gold	3.67%	70% (in the rate)	₹1,00,000	0.5%	14.6	**₹73**
Loan against property	1.05%	45% approved	₹25,00,000	1%	2.2	**₹561**
Home	0.7%	45% approved	₹30,00,000	0.5%	1.5	**₹225**
Consumer durable	2%	lender's call	₹20,000	2%	3.3	**₹13**
Two-wheeler / e-rickshaw	0.5%	lender's call	₹1,50,000	1%	0.8	**₹13**
All other lenders' loans						**₹884**

ONLINE LTV/CAC AT EACH END

Gold: the most common
Gold loans average ₹1.96 lakh across India; we plan ₹1 lakh for this segment at a 0.5% payout (DSA rates 0.25–1.5%), with 70% of applications approved.

Property and home: rare but large
Founders' sizes: ₹25 lakh against property, ₹30 lakh for a home (India's average home loan ~₹32 lakh). Payouts 0.5–1.5% and 0.25–0.75%; secured, so 45% approved.

Durables and vehicles: small
No outside data on take-up or payout for these two; both are our assumptions, counted for savers only (outside the 35% funnel), together ₹26 a saver.

Loans a year for gold, property and home = 35% × that type's share of applications (our assumption; gold × 70% approved). Each type: a monthly chance among users who have not yet bought one; one referral fee, on disbursal; gold, property and home reach every KYC'd user, durables and vehicles savers only. Rounded; rows may not add exactly.

INSURANCE, CARDS AND OTHER PRODUCTS

Cards and everyday products add ₹96 per online saver over five years; insurance counts nothing until its fixed fee is agreed

PRODUCT	TAKE-UP A YEAR	TICKET	OUR COMMISSION	RENEWS	₹ PER SAVER WON, 5 Y
Small health / hospital cash	6%	₹800	14%	50%	₹0
Family health cover	2%	₹8,000	14%	75%	₹0
Term life (small cover)	3%	₹1,000	20%	75%	₹0
Personal accident	5%	₹250	14%	50%	₹0
Two-wheeler insurance	15%	₹1,000	4.75%	70%	₹0
Mobile / device insurance	3%	₹500	13%	once	₹0
Shop insurance (fire and burglary)	3%	₹700	14%	65%	₹0
NPS	3%	–	₹200 once	once	₹10
FD via partner banks	10%	₹10,000	0.5%	once	₹7
Mobile recharge	25%	₹2,600 a year	2%	100%	₹32
Bill payments	25%	24 bills a year	₹2 a bill	100%	₹29
Cards (once per saver)	3%	–	₹1,000 a card	once	₹18
All of these					**₹96**

Small on purpose: 2% of revenue

Cards and everyday products are where we expect to earn on top; we count them cautiously and the plan does not depend on them.

Insurance: a fixed fee, not counted

We plan to refer savers to a broker partner for a fixed fee, to be agreed; a share of the broker's commission would need our own licence. With our own corporate-agent registration, insurance would add ₹76 a saver (7.9×).

Widest ranges, smallest effect

Every one of these moves LTV/CAC by 0.07× or less across its whole range (mobile recharge is the largest).

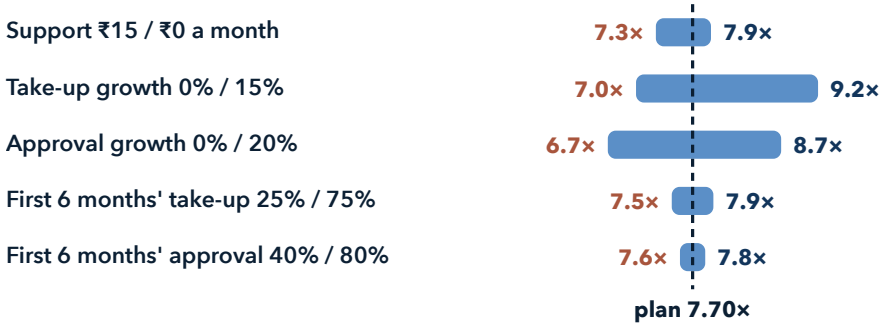

Take-up: share of savers still saving who do not yet hold it, a year. Policies renew yearly at the rate shown; habits (recharge, bills) keep running. Off: the Choti SIP incentive (our daily SIP disqualifies it) and digital gold (none at launch). Rounded; rows may not add exactly.

COST TO SERVE, AND THE FIRST MONTHS

Serving costs about ₹24 a month per saver still saving: support, tech for every KYC'd user, and weekly debits; with no debit cost LTV/CAC is 8.1×

ASSUMPTION	VALUE	RANGE WE TEST	WHERE IT COMES FROM
Support cost per saver still saving	**₹5**	₹0 – ₹15	Founder's figure
Tech cost per KYC'd user reached, a…	**₹4**	fixed	The 2 Oct costing: ₹4 a month
Payment cost per debit	**₹2**	fixed	₹2 base; ₹0 via BSE StAR MF if confirmed
Debits a month per saver still saving	**4.33**	fixed	Weekly until daily is confirmed
Months 1–6: take-up of every product,…	**50%**	25% – 75%	Founder's judgement
Months 1–6: loan and card approvals,…	**60%**	40% – 80%	New vs repeat approval gap (XL-41)
Take-up of every product rises each…	**5%**	0% – 15%	Our judgement; no data
Approvals rise each business year…	**10%**	0% – 20%	Our judgement (lenders see repayments)

ONLINE LTV/CAC AT EACH END

Serving ₹501 over 5 years

₹5 a month of support; ₹4 of tech for each of the 2.5 KYC'd users who came with the saver, savers or not; ₹2 a debit, weekly, until a daily SIP on one mandate is confirmed in writing. Daily debits at no cost to us would give 8.1×.

Slow first months

A saver of a few weeks is not ready to buy: in months 1–6 every product's take-up is half the full rate and lenders approve 60% as many, because the saving record is thin.

History helps, but only to year 5

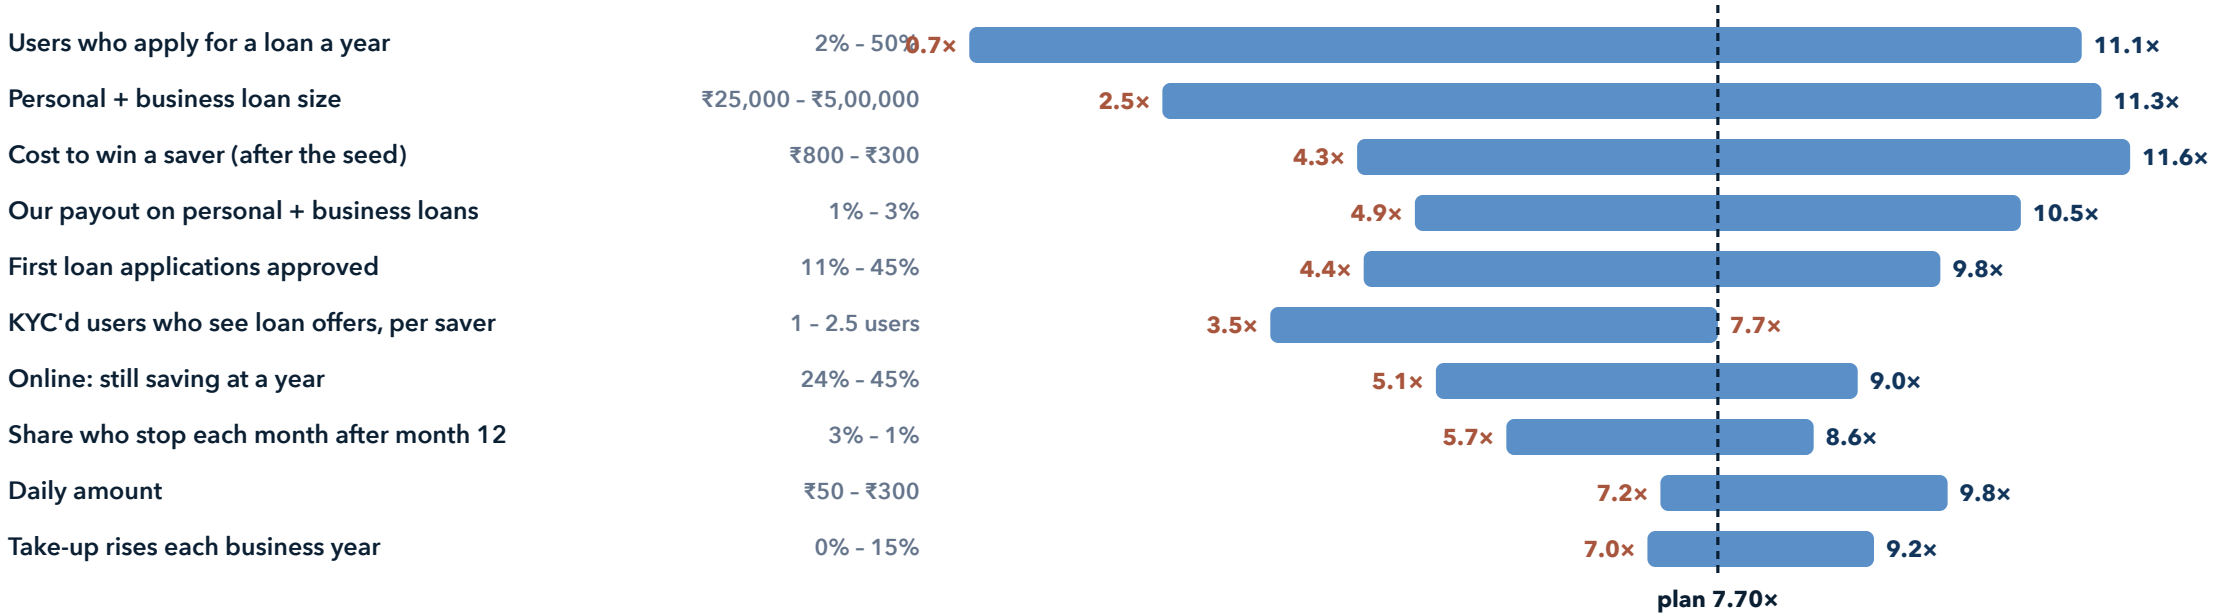

Each year the business runs, take-up rises 5% and approvals 10% (lenders see repayments); both stop rising after year 5. A saver who joins later starts higher.

Caps: no take-up above 2× the agreed rate, no first-loan approval above 80%. The team, office, brand, compliance and lender integration are company costs, outside this view.

ONE INPUT AT A TIME

11 inputs each move LTV/CAC by 1.5 turns or more (loan size: 2.5× to 11.3×): how many apply, loan size, the cost to win, the payout, approvals, how many see offers, how many keep saving, both: share who stop each month after month 12, the daily amount, take-up of every product rises each business year and approvals rise each business year (lenders see our repayments)

ONLINE LTV/CAC (5 YEARS) WITH EACH INPUT AT THE LOW AND HIGH END OF ITS RANGE, EVERYTHING ELSE AT THE PLAN

Each bar: the input at each end of its tested range, every other input at the plan; the range reads in the bar's order, left to right. Online saver, first five years.

11 inputs lead

How many apply, loan size, the cost to win, the payout, approvals, how many see offers, how many keep saving, both: share who stop each month after month 12, the daily amount, take-up of every product rises each business year and approvals rise each business year (lenders see our repayments)

Retention matters, but less than feared

Still saving at a year (24–45%) moves LTV/CAC by 3.9 turns: KYC'd users who never save still see loan offers, so revenue does not fall as fast as savers do.

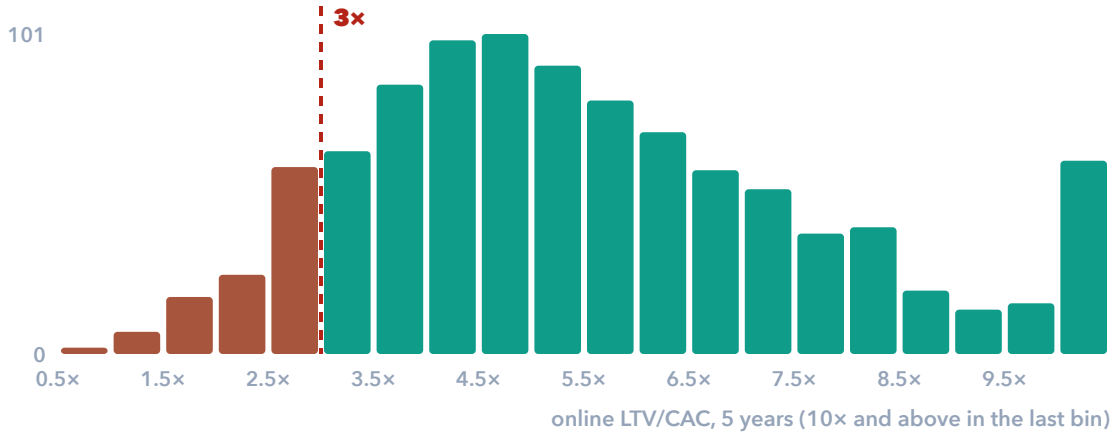

67 of the other 81 inputs barely matter

Each moves LTV/CAC by under 0.2×; every product and card assumption is among them (insurance counts nothing for now). The full list is on the workbook's 'What moves it' tab.

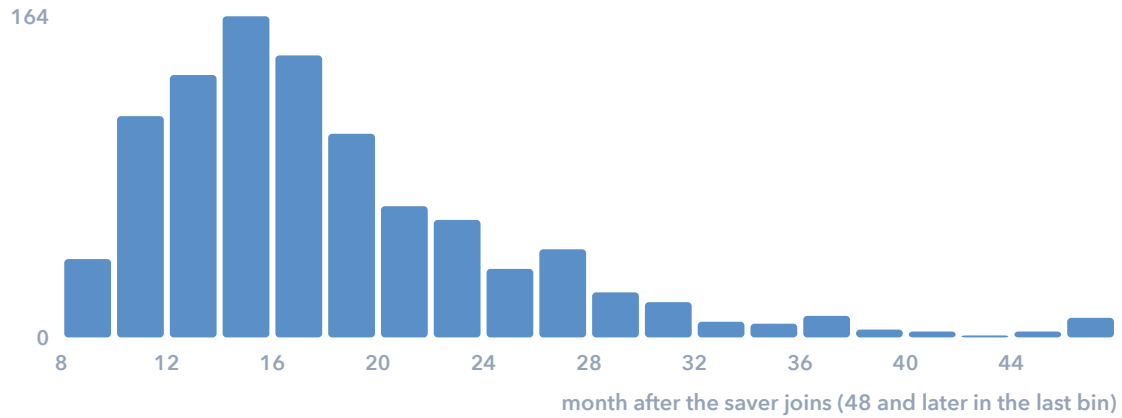

MONTE CARLO · OUR OWN RANGES, NOT OBSERVED ODDS: A STRESS TEST, NOT A FORECAST

Across 1,000 simulated futures the online saver's median LTV/CAC is 5.2×; 89% of futures reach 3×, and 1 in 10 falls below 2.9×

ONLINE LTV/CAC, 5 YEARS: FUTURES PER BIN, OF 1,000

ONLINE: MONTH THE SAVER PAYS BACK, FUTURES PER BIN

	10TH PERCENTILE	MEDIAN	90TH PERCENTILE	SHARE AT 3× OR MORE
Online LTV/CAC, 5 years	2.9×	5.2×	8.8×	89%
Online LTV/CAC, 8 years	4.7×	8.1×	13.9×	98%
Online pays back in month	11	16	27	85% by month 24
Doorstep LTV/CAC, 5 years	2.7×	4.6×	7.5×	85%
Doorstep pays back in month	15	21	31	71% by month 24

91 inputs drawn at once from their ranges (Latin hypercube, the same 1,000 futures as the company Monte Carlo); the plan is each range's most likely value and the low ends reach the evidence. Linked: loan demand with retention, the cost to win with reach, and more applicants with smaller loans and lower approval. The cost to win runs from ₹300 to ₹800, as costs can rise with scale. The plan (7.7×) sits above the median mainly because loan reach is drawn between 1 and 2.5 users, with the plan at the top. Red bars: below 3×.

THE CREDIT BET

7.7× holds only if one bet comes true

The bet: our savers earn more and want credit, and their saving history makes lenders say yes more often and lend more. If it is true, loan size, how many borrow and what lenders pay rise together; if it is false, they fall together.

Average personal or business loan
₹3 lakh needs ₹40–50k a month of income; our savers earn ₹20–40k

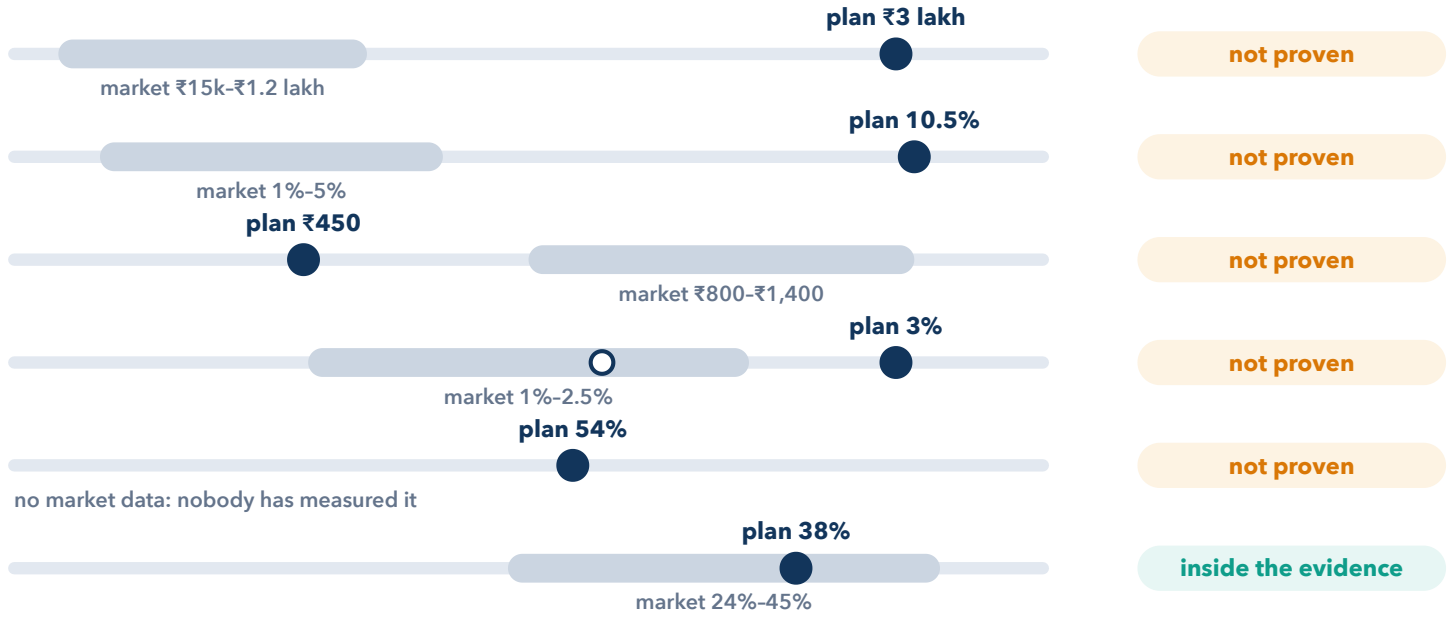

Reachable users who take a first loan, a year
35% apply × 30% approved

Cost to win a saver
lower is better; our own seed budget is ₹600

Lender payout on personal and business loans
starts at 2% (open dot), 3% by year 5

Value from KYC'd users who never save
54% of the 7.7× comes from them

Still saving after a year
from savings apps to a daily SIP

Why it could be true

Daily savers who ask to see loan offers are the most credit-ready users an app has, and a saving record is data a lender can use.

Why it may not be

Our interviews put savers at ₹20–40k a month. Higher earners borrow bigger, but investing apps pay ₹800–1,400 to win them.

How we will know

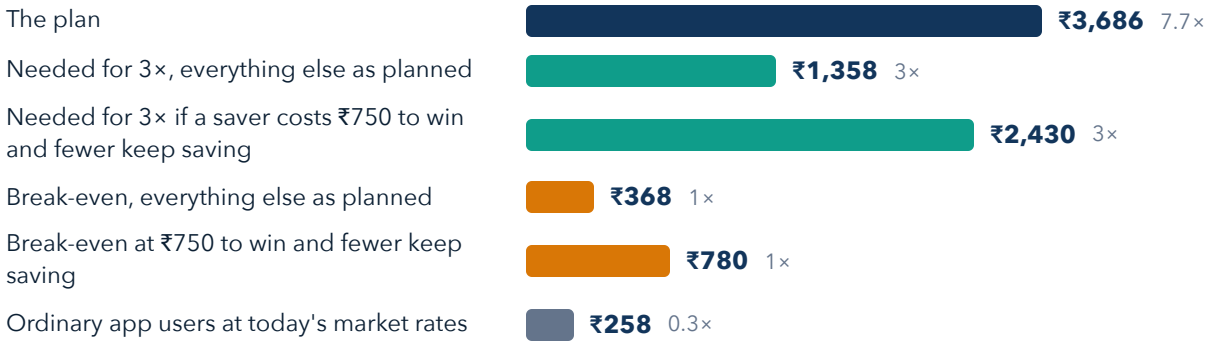

Five checks, most before any money is lent (two pages on): pre-screen, terms, who signs up, opt-in, cost to win.

Market: first loans ₹5,000–25,000 and 1–5% of app users borrowing a year (Paytm, Kissht and PhonePe filings, 2025–26); Kissht approves 11% of new applicants (prospectus, 2026); the largest investing app pays ₹800–1,400 per new investor (shareholder letters, 2025–26); DSA rate cards 1–2.5%; still saving after a year 24–45%. Income needed: the EMI at 24% a year over 18 months, at 40–50% of income.

THE ONE NUMBER

What has to be true: lenders pay us ₹3,686 per saver won in the plan; 3× needs ₹1,358 and break-even ₹368

LENDER FEES PER ONLINE SAVER WON, FIRST 5 YEARS (₹)

What that means in loans: personal and business loans per 100 savers won over five years, at each average loan size (other lenders' loans not counted, so these are the most needed). The plan has 38 at ₹3 lakh.

AVERAGE LOAN	BREAK-EVEN	3×	3× AT ₹750 AND FEWER KEEP SAVING
₹50k	30	112	200
₹1 lakh	15	56	100
₹3 lakh	5	19	33

Why this number

Lender fees are 85% of a saver's revenue. The 7.7× holds only if lenders pay about ₹3,686 per saver won; below ₹1,358 it falls under 3×.

Today's market

On the largest payments and lending apps, 1–5% of users take a loan in a year and first loans are ₹5,000–25,000. Nobody has measured savers who choose to see lender offers.

What the seed measures

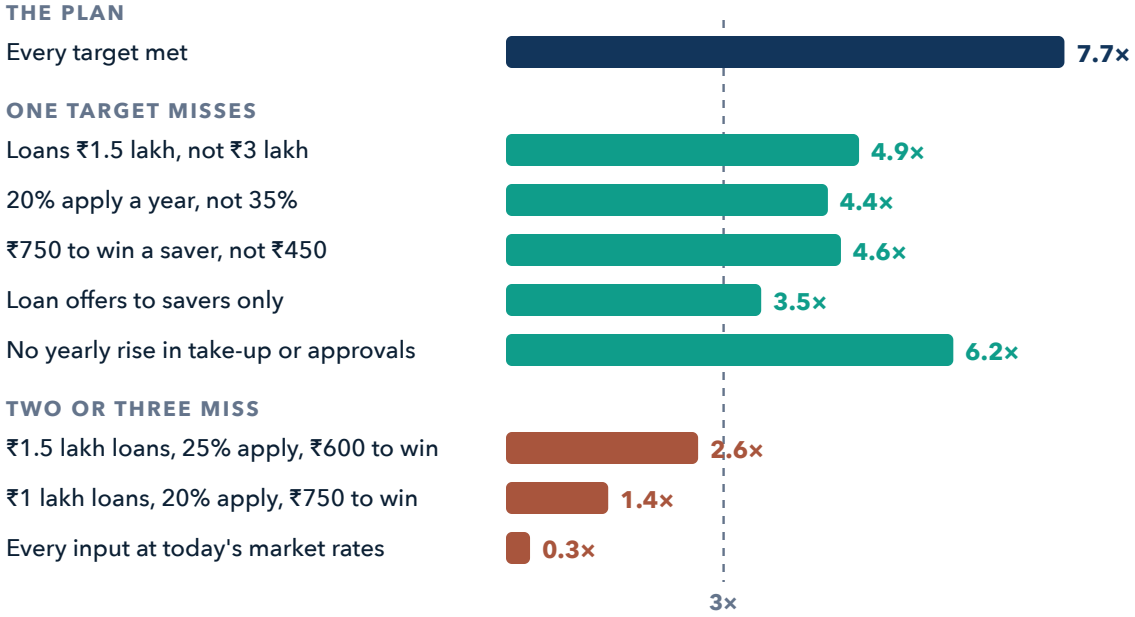

Month by month: the share of KYC'd users who opt in to offers, first loans per 100, the median approved loan, and the fee lenders pay after clawbacks, in writing.

Lender fees per saver won: every loan referral fee from one online saver won and the KYC'd users who came with them, over five years, after payouts taken back. Fewer keep saving: 35% still saving at a year and 2.5% stopping each month after, the middle of the evidence. Today's market rates: 20% of reachable users apply a year, 20% of first applications approved, ₹50,000 personal and business loans, ₹12 lakh home and ₹5 lakh property loans, a 2% payout with no rise, 0.62% fund trail, ₹750 to win a saver.

HOW FRAGILE, AND HOW WE FIND OUT

Any one target can miss and it stays at 3.5× or more; two misses take it below 3×. Five checks tell us which it is before we scale

ONLINE LTV/CAC, 5 YEARS, EVERYTHING ELSE AS PLANNED

FIVE CHECKS BEFORE WE SCALE

1. **A lender's pre-screen.** A lending partner soft-checks the credit of our first 1,000 KYC'd sign-ups: the approval rate and the loan each could get. Weeks, and no money lent.
2. **Terms in writing.** The payout, clawbacks and approval rules for savers with 3–6 months of daily saving, in a signed letter.
3. **Who signs up.** The income of the first sign-ups. It sets the loan size more than anything we assume.
4. **Opt-in and apply.** How many KYC'd users ask to see lender offers, and how many apply in their first 3 months.
5. **The real cost to win.** What the pilot pays per saver who makes a first debit, month by month.

The pass mark: lender fees on track for ₹1,358 per saver won for 3×, ₹368 to break even (the one-number page). If checks 1 and 2 come back strong, the bet has evidence behind it; if they come back at market levels, we know before the money goes into scale.

One target misses: only that input changes. Two or three miss: the inputs named change together. Today's market rates: as on the one-number page. A soft credit check reads a bureau file without touching the person's score.

THE TESTS THAT MATTER

The loan funnel decides it: below 20% applying, the median LTV/CAC is 3.1× (0.7× at 2%); futures under 3× push company profit from month 36 to 48

IN FUTURES WHERE…	SHARE OF FUTURES	MEDIAN ONLINE LTV/CAC	MEDIAN PAYBACK MONTH
Fewer than 20% apply for a loan a year	10%	3.1×	26
Fewer than 30 in 100 still saving at a year	5%	2.9×	27
Cost to win above ₹525	32%	4.4×	18
All 1,000 futures	100%	5.2×	16
Only 2% apply (nearest observed), all else as planned	one test	0.7×	71

SAME FUTURES, THE WHOLE COMPANY (PROFITABLE PATH)	SHARE	MEDIAN PROFIT MONTH	MEDIAN MONEY NEEDED
Online LTV/CAC under 3×	11%	48	$3.6M
Online LTV/CAC 3× or more	89%	36	$2.2M

The plan returns 7.7×. Where one input alone takes it down to 3×, and below 2× (everything else at the plan):

ONE INPUT AT A TIME	PLAN	DOWN TO 3× AT	BELOW 2× AT
Apply for a loan a year	35%	13%	8%
Loan size	₹3 lakh	₹51k	–
Payout at the start	2%	0.34%	–
Still saving at a year	38%	13%	8%
Cost to win, pre-contingency	₹450	₹1,155	₹1,733
Daily amount	₹100	–	–
Users who see offers	2.5	–	–

(– : not reached in the range tested.) Two levers outside the loan funnel: daily debits at no cost to us (once BSE confirms) give 8.1×; our own insurance licence gives 7.9×.

Rules on digital lending and on referral payouts could change what lenders pay.

Test the loan funnel first

How many KYC'd users apply, and how many are approved, is the least-observed and most powerful number. We plan to measure both with the seed's first lending partner.

Then retention and the cost to win

We plan to measure both from the first cohort: cost per saver won each month, and the share still saving at months 3, 6 and 12.

Ask the workbook

Every line here is a live question on the workbook's Projector tab; it filters the 1,000 futures by any input and reports any result.

Company: the profitable path, 20,000 online savers won a month from month 30. Money needed: the peak cash spent before profit, in $ at ₹95. Same 1,000 futures as the LTV/CAC, so each row is one consistent future.

HOW TO CHECK ANY NUMBER HERE

Every number in this deck is a cell in the LTV/CAC workbook: change an assumption and the per-saver answer moves live

TAB	WHAT IT HOLDS
LTV-CAC	The answer, live: waterfall, LTV/CAC over 5 and 8 years, payback, for both savers; the 1,000 futures' summary; next to the plan model's values (gap 0).
Projector	Ask the 1,000 futures anything: any result, any percentile, the share above a line, with up to three filters on any input.
Inputs	125 assumptions (91 drawn in the Monte Carlo, 34 fixed), each with its value, unit, range, source and reason; 20 worked-out values in grey.
Saver	One saver won, months 1–96, online and doorstep: still saving, deposits, balance, each revenue line, serving, cumulative after the cost to win.
Engine, Products	The month-by-month machinery: the fund, first, repeat and top-up loans, cards, and 19 products with their renewals.
Monte Carlo, What moves it, Sources	The 1,000 futures (values), every input one at a time with rank correlations, and the research behind each source ID.

Checked to the rupee

Every formula was replayed by an independent formula engine and matches the plan's model at the plan and at five Monte Carlo futures spread from 1.9× to 12.3×: LTV/CAC to six decimals, the payback month exactly.

Live where it matters

The one-saver model is about 13,000 live formulas: change ₹100 a day to ₹300 and LTV/CAC moves from 7.70× to 9.85× in the sheet. The 1,000 futures and the one-at-a-time tests are values, rerun on request.

Shareable

The workbook: docs.google.com/spreadsheets/d/1VdZy4vSSaTQmrp--txW31fjN8nHlF2iLQnLsUeAKTP4

Blue cells are assumptions; grey cells are worked out. The arithmetic is checked; the assumptions are ours. The Monte Carlo and one-at-a-time tests are rerun on request when assumptions change.

Ranges are PERT draws: a smooth hump between the low and high end, peaking at the plan's value, so most futures sit near it. Fixed = not drawn. Ends: online LTV/CAC with the input at its low and then its high end, everything else at the plan (doorstep where only the doorstep saver is affected).

A7 · EVERY PRODUCT'S MONEY

What each product brings in from one online saver won

PRODUCT	STREAM	₹ PER ONLINE SAVER WON, 5 YEARS	8 YEARS
Small health / hospital cash (fixed fee, not counted)	Insurance	₹0	₹0
Family health cover (fixed fee, not counted)	Insurance	₹0	₹0
Term life (small cover) (fixed fee, not counted)	Insurance	₹0	₹0
Personal accident (fixed fee, not counted)	Insurance	₹0	₹0
Two-wheeler insurance (fixed fee, not counted)	Insurance	₹0	₹0
Mobile / device insurance (fixed fee, not counted)	Insurance	₹0	₹0
Shop insurance (fire and burglary) (fixed fee, not counted)	Insurance	₹0	₹0
Equity/hybrid SIP trail (off: the core savings are the SIP)	Other products	₹0	₹0
Choti SIP incentive (off)	Other products	₹0	₹0
NPS	Other products	₹10	₹12
Digital gold (off)	Other products	₹0	₹0
FD via partner banks	Other products	₹7	₹9
Mobile recharge	Other products	₹32	₹51
Bill payments	Other products	₹29	₹47
Gold loan (other lenders)	Other lenders' loans	₹73	₹92
Consumer-durable loan (savers only)	Other lenders' loans	₹13	₹17
Two-wheeler / e-rickshaw loan (savers only)	Other lenders' loans	₹13	₹16
Home loan (affordable housing)	Other lenders' loans	₹225	₹313
Loan against property (shop or home)	Other lenders' loans	₹561	₹778
Personal + business loans (our DSA payout)	Loans	₹2,802	₹4,301
Cards	Cards	₹18	₹18
Fund trail	Fund	₹531	₹989
Revenue		**₹4,313**	**₹6,642**

Loans count every KYC'd user reached (2.5 per online saver won). The extra equity SIP is off while the core savings are the equity SIP.

A11 · HOW THE MODEL WORKS

The month-by-month rules behind one saver's value

STEP	HOW IT IS WORKED OUT, EVERY MONTH
Who keeps saving	A steady monthly drop-off within months 1–3, another within months 4–12 (set by the share at month 3 and at month 12), then 1.5% a month.
The fund	Balance = last month's balance less 1% withdrawn, plus deposits, plus the blended return on both. Our trail = average balance × 0.67% ÷ 12.
Loans	Each reachable user is in one of three states: never borrowed, repaid and able to borrow again, or repaying. Each month a share applies (35% a year spread over 12 months, × the take-up factor); approved first loans move to repaying; 18 months later they can borrow again.
Top-ups	Borrowers with 12+ EMIs paid and EMIs still due: 15% a year take a top-up of 40% of the original loan, at most one per loan.
Payouts	Money lent × the payout (2% rising in a straight line to 3% by month 60) × (1 − 2.5% taken back). Counted for 2.5 KYC'd users per online saver.
Products	For each product, the share not yet holding it buys at a monthly rate (the yearly take-up spread over 12 months × the take-up factor). Policies renew yearly at their renewal rate; habits keep running; insurance counts a fixed referral fee, to be agreed (₹0 here); the Choti SIP incentive and digital gold are off.
Factors	Take-up factor: 50% in months 1–6, then 100%, × 1.05 per business year to year 5 (cap 2×). First-loan approval: 30% × 60% in months 1–6 × 1.10 per year (cap 80%).
Serving and payback	Serving = share still saving × (₹5 support + ₹4 tech × KYC'd users reached + ₹2 × 4.33 weekly debits). Cost to win = ₹450 × 1.1 contingency. Cumulative = −cost to win + Σ(revenue − serving); pays back in the first month it reaches zero.

These are the rules on the workbook's Engine, Products and Saver tabs, one column each.
