What one saver is worth

LTV/CAC in eight pages: how one saver makes money, and how each assumption changes the number.

₹495

to win one online saver
(₹450 + our 10% contingency)

₹3,813

back over five years,
after the cost of serving them

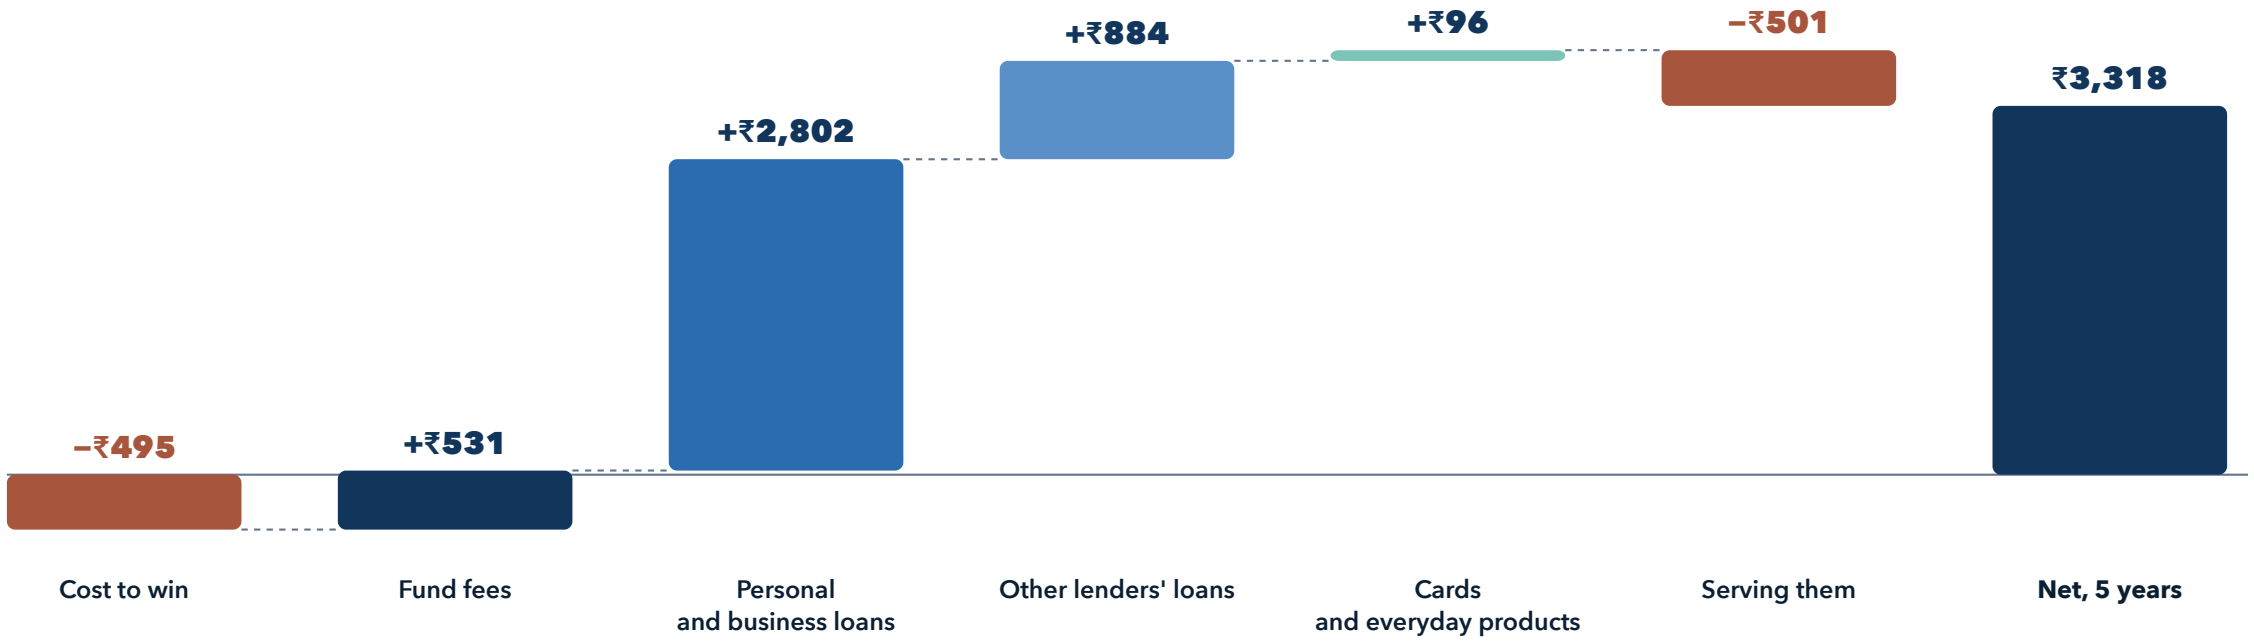

7.7×

LTV/CAC, paid back in month 12,
if our loan targets hold

Loans are 85% of the money. At today's market rates for app users the same saver returns 0.3×. The seed's first job is to find out which world we are in.

HOW ONE SAVER MAKES MONEY

One online saver: ₹495 to win, ₹3,813 back in five years: 7.7×

Loans make the money
Lenders pay us a referral fee on every loan we bring: ₹3,686 of the ₹4,313 a saver brings in five years.

Saving pays its own way, just
Fund fees (₹531) about cover the cost of serving a saver (₹501): support, tech and payments.

7.7×
₹3,813 back (revenue less serving) on ₹495 to win, paid back in month 12.

One online saver won, months 1–60, undiscounted. Net after the cost to win = LTV less the cost to win.

WHERE THE LOAN MONEY COMES FROM

100 savers won bring 250 people who can see loan offers; 38 loans later, that is ₹2,802 a saver

100
savers won

→

250
KYC'd users see loan offers (5 sign-ups a saver, half finish KYC)

→

35%
of them apply for a loan each year

→

30%
of first applications approved

→

38 loans
in five years, ₹3.0 lakh on average: ₹115 lakh lent

→

₹2,802
in fees per saver won (about 2.4% of each loan)

The three loan targets
35% apply a year, 30% approved, ₹3 lakh loans. Together they make ₹2,802 of the ₹3,813.

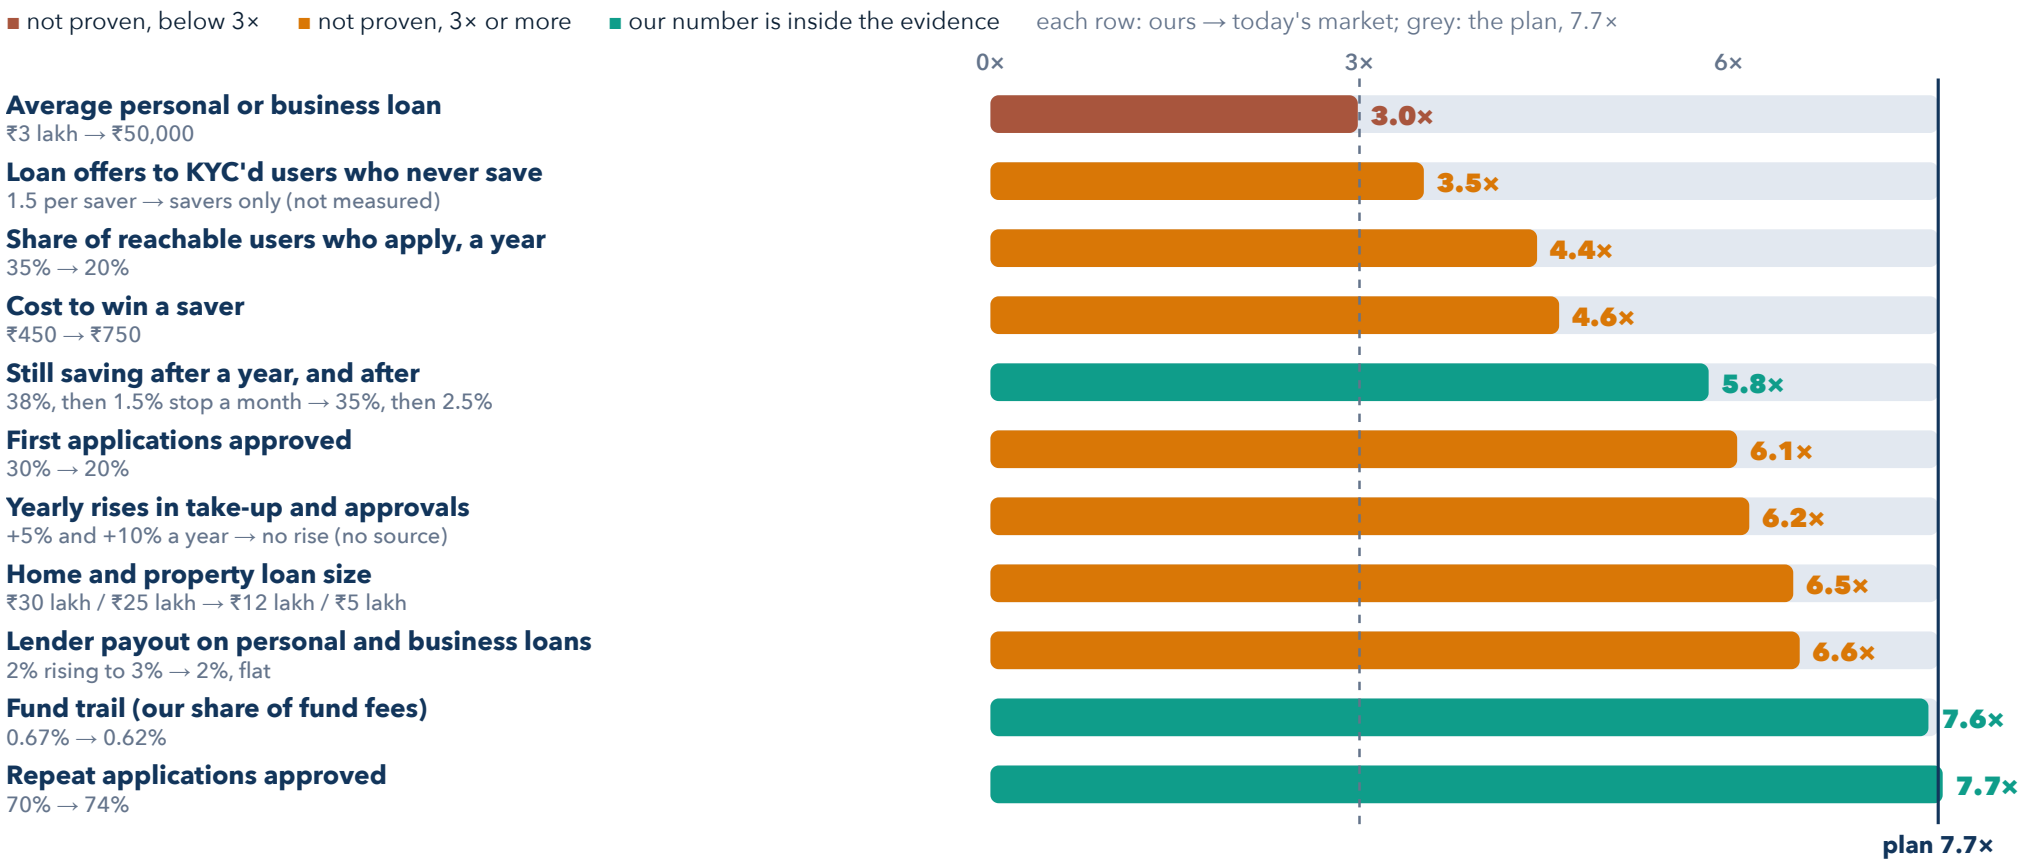

Other lenders' loans
Gold, property and home loans referred to other lenders add ₹884, most of it from a few large property and home loans.

Who pays
The lender, once, when the loan is paid out; part comes back if a loan closes or goes bad within six months. We never lend our own money.

Per 100 online savers won, first five years. Offers reach users while the saver who brought them keeps saving.

ONE AT A TIME

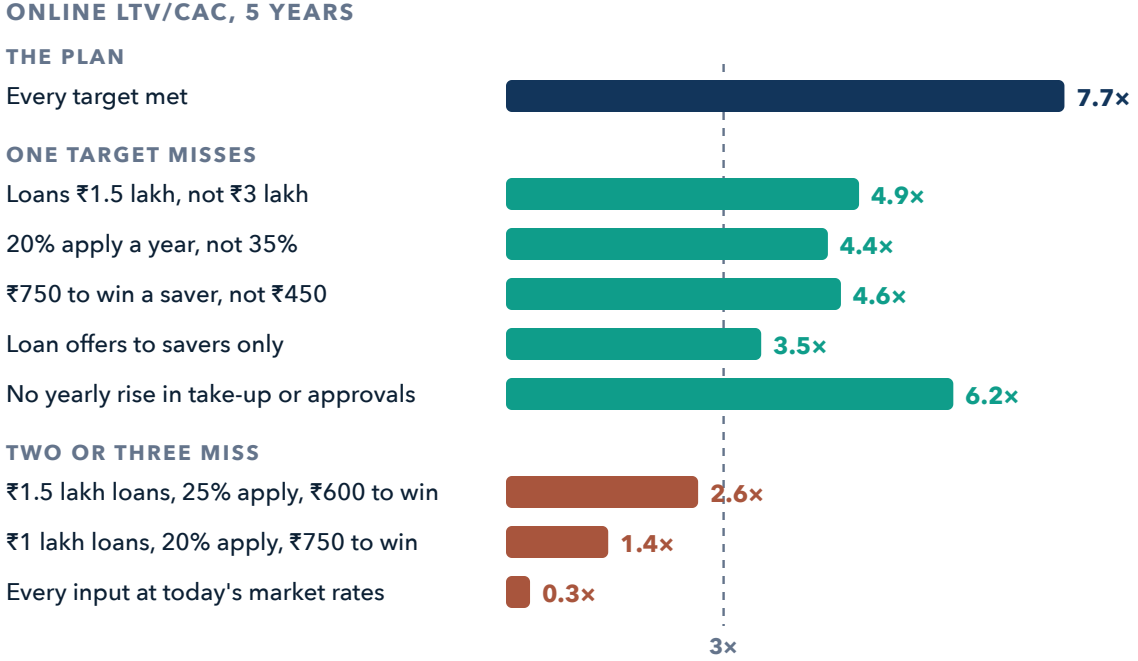

Change one assumption to today's market value and see the number: average personal or business loan moves it most, to 3.0×

Each bar: online LTV/CAC over five years with that one assumption at the market value and everything else as planned. Market values: the middle of the 2024–26 evidence; sources on the last page.

WHEN TARGETS MISS TOGETHER

One target can miss and it stays at 3.5× or more; two together take it below 3×

One miss is survivable. Any single target can fall to the market and the saver still returns 3.5× or more.

Two misses are not. The targets are linked: smaller savers borrow smaller loans, less often. When two fall together the answer drops below 3×.

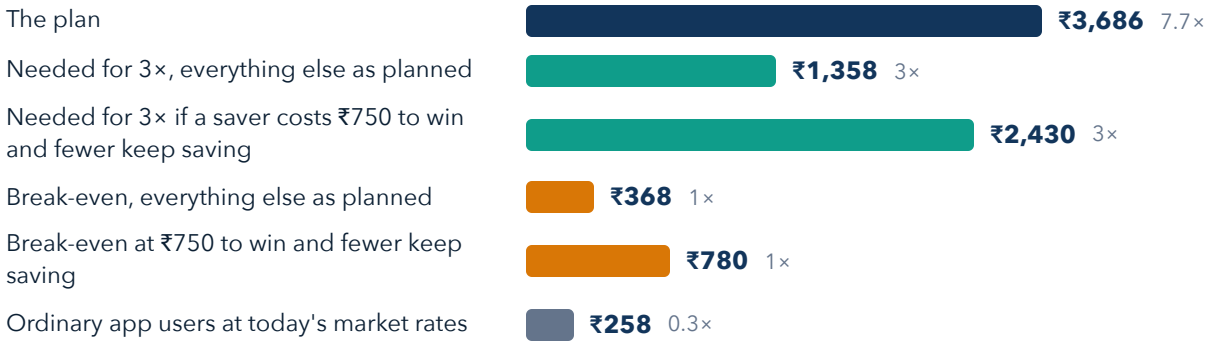

So it is one bet: our savers earn more and want credit, and their saving record makes lenders say yes more often and lend more. If it holds, the targets hold together.

One target misses: only that input changes. Two or three miss: the inputs named change together. Today's market rates: every input at the middle of the evidence.

WHAT LENDERS MUST PAY US

What has to be true: lenders pay us ₹3,686 per saver won in the plan; 3× needs ₹1,358 and break-even ₹368

LENDER FEES PER ONLINE SAVER WON, FIRST 5 YEARS (₹)

What that means in loans: personal and business loans per 100 savers won over five years, at each average loan size (other lenders' loans not counted, so these are the most needed). The plan has 38 at ₹3 lakh.

AVERAGE LOAN	BREAK-EVEN	3×	3× AT ₹750 AND FEWER KEEP SAVING
₹50k	30	112	200
₹1 lakh	15	56	100
₹3 lakh	5	19	33

Why this number

Lender fees are 85% of a saver's revenue. The 7.7× holds only if lenders pay about ₹3,686 per saver won; below ₹1,358 it falls under 3×.

Today's market

On the largest payments and lending apps, 1–5% of users take a loan in a year and first loans are ₹5,000–25,000. Nobody has measured savers who choose to see lender offers.

What the seed measures

Month by month: the share of KYC'd users who opt in to offers, first loans per 100, the median approved loan, and the fee lenders pay after clawbacks, in writing.

Lender fees per saver won: every loan referral fee from one online saver won and the KYC'd users who came with them, over five years, after payouts taken back. Fewer keep saving: 35% still saving at a year and 2.5% stopping each month after, the middle of the evidence. Today's market rates: 20% of reachable users apply a year, 20% of first applications approved, ₹50,000 personal and business loans, ₹12 lakh home and ₹5 lakh property loans, a 2% payout with no rise, 0.62% fund trail, ₹750 to win a saver.

FIVE CHECKS

Five checks tell us whether the bet holds, most of them before we lend a rupee

1

A lender's pre-screen

A lending partner soft-checks the credit of our first 1,000 KYC'd sign-ups.

Pass: approval near 30%, eligible loans near ₹3 lakh

2

Terms in writing

The payout, clawbacks and approval rules for savers with 3–6 months of saving, signed.

Pass: a payout of 2% or more after clawbacks

3

Who signs up

The income of the first sign-ups; it sets the loan size more than anything we assume.

Pass: income of ₹40k+ a month for ₹3 lakh loans

4

Opt-in and apply

How many KYC'd users ask to see lender offers, and how many apply in 3 months.

Pass: 35% or more opting in

5

The real cost to win

What the pilot pays per saver who makes a first debit.

Pass: ₹600 or less in the seed, ₹450 after

Checks 1 and 2 need no money lent and take weeks. If they pass, 7.7× has evidence behind it. If they come back at market levels, we know before the money goes into scale, and we change the plan: bigger savers, a cheaper way to win them, or more per loan.

Pass marks are the plan's own targets. A soft credit check reads a bureau file without touching the person's score.

EVERY ASSUMPTION ON ONE PAGE

Our numbers against today's market, and what each does to the 7.7×

ASSUMPTION	OURS	TODAY'S MARKET	LTV/CAC AT MARKET	INSIDE THE EVIDENCE?	WHERE THE MARKET FIGURE COMES FROM
Average personal or business loan	₹3 lakh	₹50,000	**3.0×**	no	first loans ₹5,000–25,000; digital lenders ₹15,000–1.2 lakh (bureau, FACE)
Loan offers to KYC'd users who never save	1.5 per saver	savers only (not measured)	**3.5×**	no	not measured anywhere
Share of reachable users who apply, a year	35%	20%	**4.4×**	no	1–5% of app users borrow a year (Paytm, Kissht, PhonePe filings)
Cost to win a saver	₹450	₹750	**4.6×**	no	₹800–1,400 per new investor at the largest investing app
Still saving after a year, and after	38%, then 1.5% stop a month	35%, then 2.5%	**5.8×**	yes	24–45% at a year; 1–4% a month after
First applications approved	30%	20%	**6.1×**	no	11% of new applicants at an app lender (prospectus)
Yearly rises in take-up and approvals	+5% and +10% a year	no rise (no source)	**6.2×**	no	no source found
Home and property loan size	₹30 lakh / ₹25 lakh	₹12 lakh / ₹5 lakh	**6.5×**	no	mass-market lenders ₹10–15 lakh / ₹3–10 lakh
Lender payout on personal and business loans	2% rising to 3%	2%, flat	**6.6×**	no	rate cards 1–2.5%, flat
Fund trail (our share of fund fees)	0.67%	0.62%	**7.6×**	yes	0.50–0.88% equity, 0.08–0.50% debt
Repeat applications approved	70%	74%	**7.7×**	yes	74% of repeat customers at an app lender

Market figures: Indian sources 2024–26 (company filings and prospectuses, bureau and FACE reports, DSA rate cards, AMFI). The live workbook lets any assumption be changed and the answer recalculates.
