Working name, to be finalised

Online-first business case

What the numbers say when the cost to win is known and the value of a saver is not: one main case, and the company at each LTV/CAC.

October 2026 · Confidential

1.7× LTV/CAC

in the main case, the median of 1,000 draws: ₹495 to win (measured), ₹866 back over five years, paid back in month 39

Year 6

EBITDA turns positive in the main case (month 63, $4.7M raised in all, 20,000 savers a month)

23% chance of 3×

and 84% that a saver at least pays back in five years; the value of a saver is what we do not yet know

7.7× at our targets

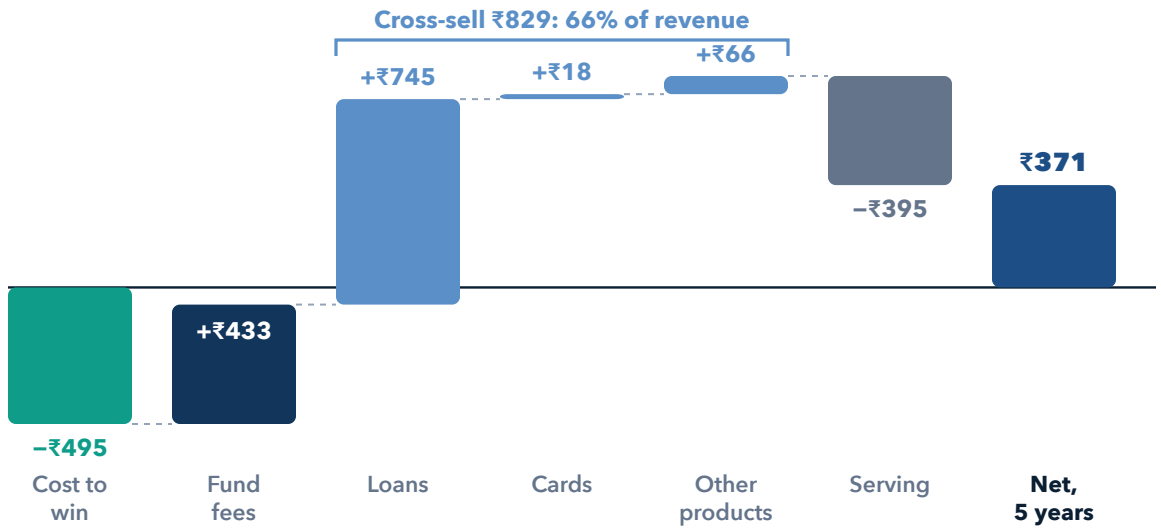

if every loan target holds: profit from month 33 on $1.8M. The seed finds out which we are nearer

Every number comes from one model: monthly groups of savers, each with the same agreed product lines, stacked into a company. Online savers at ₹100 a day; 1 in 10 savers from a doorstep pilot. Funds are bought in the saver's name; the app never holds money.

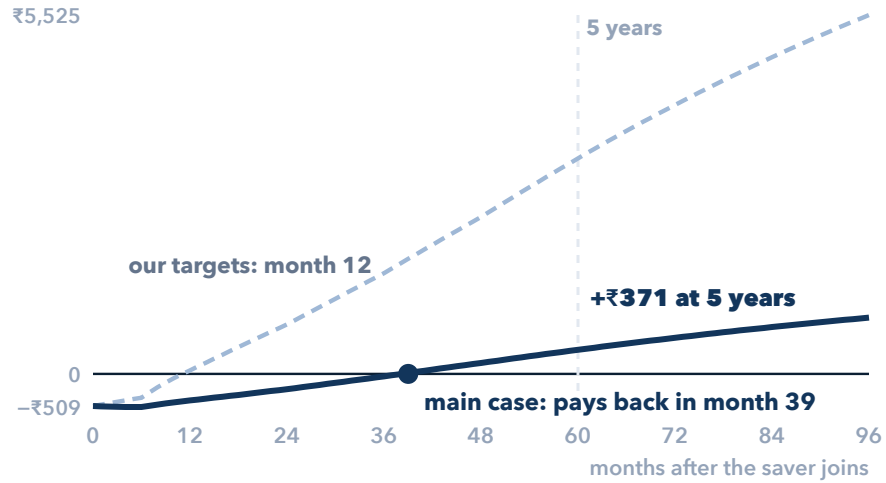

LTV / CAC, THE MAIN CASE

A saver won online costs ₹495 and returns ₹866 over five years in the main case: 1.7× LTV/CAC, paid back in month 39

ONE ONLINE SAVER WON, FIRST 5 YEARS (₹)

WHEN IT PAYS BACK: CUMULATIVE ₹ PER SAVER WON

1.7× in 5 years, 2.8× in 8

LTV/CAC = what a saver brings in, less the cost of serving them, divided by the ₹495 it cost to win them. Undiscounted.

Loans are 59% of revenue

Lender fees of ₹745 on top of ₹433 of fund fees. Saving alone about covers its serving cost; the loans make the return.

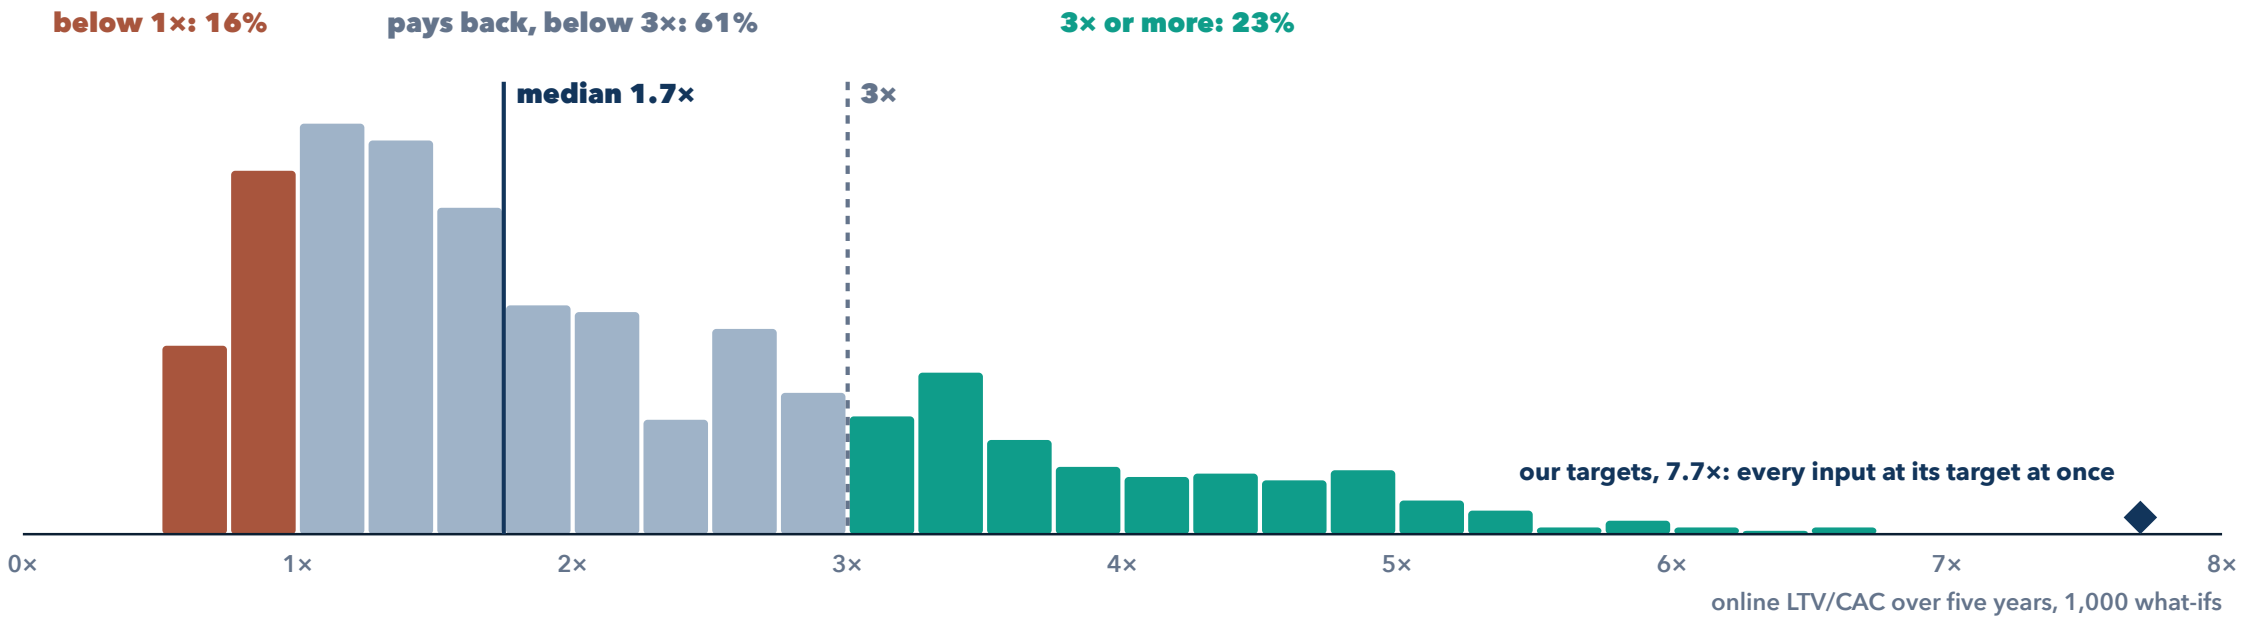

At our targets: 7.7×

Paid back in month 12 if every loan target holds at once. In the main case every input sits 48% of the way from today's market to its target.

Main case: every unmeasured input 48% of the way from today's market to our target, which gives the Monte Carlo median. ₹100 a day; 80/20 equity and debt funds. Serving = ₹5 support, ₹4 tech for each KYC'd user reached and ₹2 a weekly debit, a month while saving; the cost to win includes our 10% contingency. Not in this view: the company's fixed costs (team, office, brand).

THE ODDS

With the cost to win fixed at ₹495, the median saver returns 1.7×; 23% of the what-ifs reach 3× and 16% do not pay back in five years

Cost to win is known

₹600 in the seed and ₹450 after, measured on our own funnel, plus our 10% contingency. It is held fixed; only the value of a saver is drawn.

The value is not

Each of 10 unmeasured inputs is equally likely anywhere between today's market and our target. Loan inputs move together: savers who want credit apply more, borrow more and are approved more.

7.7× is the top corner

It needs every input at its target at the same time. None of the 1,000 what-ifs gets there; the best tenth reach 3.9× or more.

A Monte Carlo: 1,000 random what-ifs, the loan inputs moving together. Market values: the middle of the 2024–26 evidence. LTV/CAC: revenue less serving over 60 months, divided by the cost to win; undiscounted.

THE COMPANY AT EACH LTV/CAC

At the median 1.7× EBITDA turns positive in month 63 on $4.7M; at 3×, month 46 on $3.1M; at our targets, month 33 on $1.8M

LTV/CAC · CHANCE OF AT LEAST THIS	MONEY NEEDED IN ALL	EBITDA POSITIVE FROM	YEAR 5 EBITDA · 8-YEAR TOTAL
7.7× **our targets** every target at once	**$1.8M**	**month 33**	**₹68 Cr · ₹450 Cr**
5.0× chance 3%	**$2.3M**	**month 37**	**₹34 Cr · ₹231 Cr**
3.0× chance 23%	**$3.1M**	**month 46**	**₹10 Cr · ₹77 Cr**
2.0× chance 43%	**$4.2M**	**month 57**	**–₹1.2 Cr · ₹2.6 Cr**
1.7× **main case (median)** chance 50%	**$4.7M**	**month 63**	**–₹4.0 Cr · –₹15 Cr**
1.0× chance 84%	**$8.1M**	**not by year 8**	**–₹12 Cr · –₹67 Cr**
0.4× **today's market** every input at market	**$11.6M**	**not by year 8**	**–₹17 Cr · –₹102 Cr**

One plan, many outcomes

Every row is the same company: 20,000 online savers a month from month 30, the same team and the same cost to win. Only the value of a saver changes.

The main case

Every unmeasured input 48% of the way from today's market to our target gives the median, 1.7×. The financials are built on it.

What the seed buys

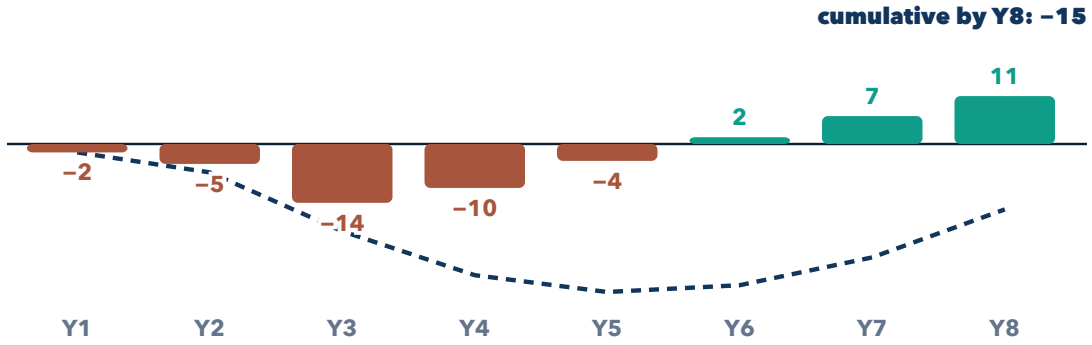

Which row we are on. The next round (money needed less the $0.5M seed) is about $4.2M at the median and $2.6M at 3×.

Each row: every unmeasured input the same share of the way from today's market to our target, solved for that LTV/CAC, and every row still scales to 20,000 savers a month. EBITDA: operating profit before tax. Chance: share of the 1,000 what-ifs at or above it. Money needed: the deepest cumulative cash hole, seed included, plus a ₹5 crore floor. Doorstep savers (1 in 10) carry the same loan inputs. Undiscounted.

THE FINANCIALS

The main case, 1.7×: EBITDA turns positive in month 63, the company needs $4.7M in all, and 8 years add up to −₹15 Cr

EBITDA (OPERATING PROFIT) BY YEAR, ₹ CRORE; CUMULATIVE DASHED

THE MAIN CASE'S INPUTS, OUR TARGET IN GREY

Average personal or business loan	**₹1.7 lakh**	₹3 lakh
Loan offers to KYC'd users who never save	**0.7 more per saver**	1.5 more per saver
Reachable users who apply for a loan, a year	**27%**	35%
Still saving after a year, and after	**36%, then 2.0% stop a month**	38%, then 1.5% stop a month
Home and property loan size	**₹21 lakh / ₹15 lakh**	₹30 lakh / ₹25 lakh
Yearly rises in take-up and approvals	**+2.4% and +5% a year**	+5% and +10% a year
First applications approved	**25%**	30%

20,000 online savers a month from month 30 after the seed, 1 in 10 from the doorstep; cost to win ₹600 in the seed and ₹450 after. Doorstep savers carry the same loan inputs as online savers. Team and other costs include the 10% contingency. Undiscounted; tax on profit after losses carried forward.

THE ONE NUMBER

What has to be true: lenders pay us ₹3,686 per saver won at our targets and ₹745 in the main case; 3× needs ₹1,358, break-even ₹368

LENDER FEES PER ONLINE SAVER WON, FIRST 5 YEARS (₹)

What that means in loans: personal and business loans per 100 savers won over five years, at each average loan size (other lenders' loans not counted, so these are the most needed). Our targets have 38 at ₹3 lakh.

AVERAGE LOAN	BREAK-EVEN	3×	3× IF FEWER KEEP SAVING
₹50k	30	112	119
₹1 lakh	15	56	59
₹3 lakh	5	19	20

Why this number

Lender fees are 85% of a saver's revenue at our targets. The cost to win is known, so this is the number that decides: below ₹1,358 per saver won, LTV/CAC falls under 3×.

Today's market

On the largest payments and lending apps, 1–5% of users take a loan in a year and first loans are ₹5,000–25,000. Nobody has measured savers who choose to see lender offers.

What the seed measures

Month by month: the share of KYC'd users who opt in to offers, first loans per 100, the median approved loan, and the fee lenders pay after clawbacks, in writing.

Lender fees per saver won: every loan referral fee from one online saver won and the KYC'd users who came with them, over five years, after payouts taken back. Cost to win ₹495 throughout (₹450 plus our 10% contingency). Fewer keep saving: 35% still saving at a year and 2.5% stopping each month after, the middle of the evidence. Main case: every unmeasured input 48% of the way from today's market to our target. Today's market: 20% of reachable users apply a year, 20% of first applications and 74% of repeats approved, no yearly rises, ₹50,000 personal and business loans, ₹12 lakh home and ₹5 lakh property loans, offers to savers only, a 2% payout with no rise, 0.62% of the fund as our fee, 35% still saving at a year and 2.5% stopping a month after.

THE FIVE NUMBERS

The $0.5M seed measures the five numbers that decide LTV/CAC, and with it whether the next round is about $4.2M or $2.6M

1

Average personal or business loan

Target ₹3 lakh; today's market ₹50k.

Chance of 3×: 0% at market, 39% at target.

2

Loan offers to KYC'd users who never save

Target 1.5 more per saver; today's market savers only.

Chance of 3×: 0% at market, 36% at target.

3

Reachable users who apply for a loan, a year

Target 35%; today's market 20%.

Chance of 3×: 3% at market, 32% at target.

4

Still saving after a year, and after

Target 38%, then 1.5% stop a month; today's market 35%, then 2.5% stop a month.

Chance of 3×: 16% at market, 30% at target.

5

Home and property loan size

Target ₹30 lakh / ₹25 lakh; today's market ₹12 lakh / ₹5 lakh.

Chance of 3×: 14% at market, 28% at target.

HOW THE SEED GETS THERE

$0.5M

the seed: build, licences, a lean team, the doorstep pilot

1 lakh

sign-ups in months 4–18 to read the five numbers

Months 16–18

12 months of data on the first savers; raise the next round (the seed budget runs to month 24 if it is late)

$4.2M or $2.6M

the next round: in the main case, or if the seed proves 3×

The seed is not a profit plan. The cost to win is already measured; the seed buys the five measurements of what a saver is worth, and they decide which row of the ladder the next round is raised on.

Chance of 3×: the Monte Carlo with that one input fixed at today's market value, then at our target, every other input still drawn. Next round: money needed in all, less the $0.5M seed. The seed plan, a separate document, has the team and the use of funds.

ASSUMPTIONS

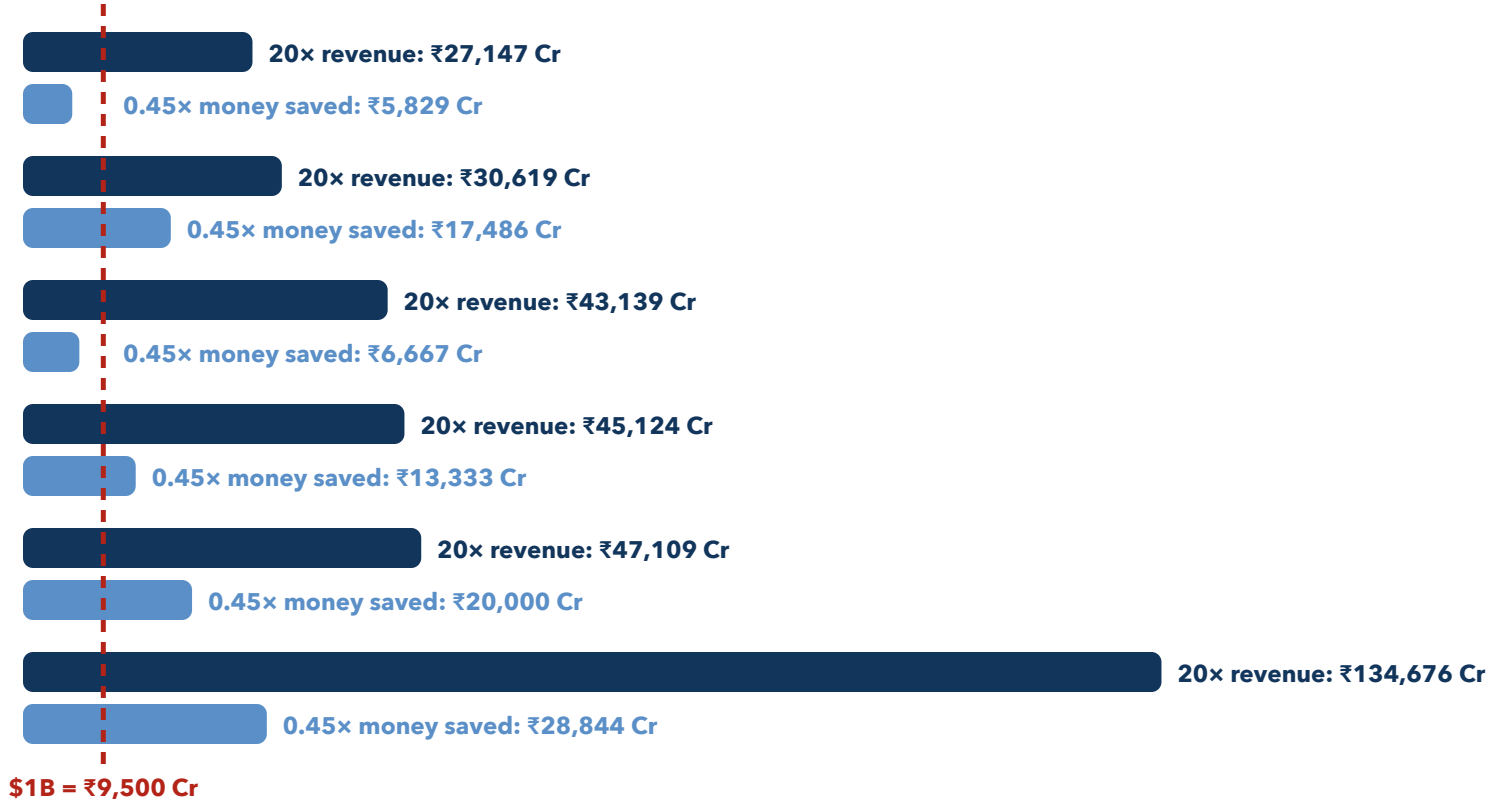

Every input, and where it comes from

INPUT	VALUE	BASIS
Online saver	₹100 a day, ~20 debit days a month; 80% still saving at month 3, 38% at a year	₹100 is our assumption (Bachatt's stated minimum). Retention: our extrapolation from SBI MF's ₹250 daily SIP for first-time investors (36% of a year's sign-ups stopped within it); savings apps' 24% is the downside
Doorstep saver	Same product; 80% still saving at month 3, 55% at a year; 100 sign-ups per agent a month, each counted as a saver	Agreed street inputs; the agent sets the mandate at sign-up. A competitor's street team reports 100–125 a person a month. All-in cost ₹405 a saver at scale (₹446 with our contingency)
Funds	80% equity SIP / 20% debt; returns 10% / 7% a year; fees 0.75% / 0.35% of balance	Mix from a practitioner conversation (not yet a filed research row); fees from fund-house disclosures; the equity return is our estimate
Cost to win a saver	₹600 during the seed (our funnel), ₹450 after, plus our 10% contingency; held fixed	Measured on our own funnel (founders, 23 Oct: "CAC is fairly sorted and measured"), so the Monte Carlo does not draw it
Loans, main case	Every loan input 48% of the way from today's market to our target: ₹1.7 lakh personal and business loans, 27% of reachable users apply a year, 25% of first applications approved, offers to 0.7 more per saver, home / property loans ₹21 lakh / ₹15 lakh	Targets: the founders' (the loans row below). Market: the middle of the 2024–26 evidence. Monte Carlo: 1,000 draws, each of 10 inputs anywhere between the two, loan inputs linked at 0.5; its median is the main case
Loans, our targets	Offers to every KYC'd user (2.5 per online saver) from day 1; 35% apply a year (70% personal or business, 15% gold, 3% property, 2% home); 30% of first applications approved, 70% of repeats; ₹3 lakh personal/business loans at a 2% payout rising to 3%; home loans ₹30 lakh, property ₹25 lakh	Founders' choice on reach and apply rate; payouts at DSA norms (1–2.5% personal and business, 0.5–1.5% property, 0.25–1.5% gold); loan sizes are the founders' numbers (22 Oct), above the digital-lender and micro-LAP averages in research/xs_funnel_2026-10-21.csv; gold from industry data
Other products	Cards, insurance (at IRDAI's draft caps), recharge, bills, FD, gold-loan and property-loan referrals	Agreed take-up and commission inputs; property ₹25 lakh and home ₹30 lakh loans (founders, 22 Oct)
Team	Seed: 2 founders at $1,000 a month + 3 hires. After the round: founders ₹1.5L, hires by active savers	Seed plan; agreed salary inputs, +10% statutory, +7% a year
Other costs	Tech ₹1.5L a month + ₹4 per KYC'd user reached; payments ₹2 a weekly debit; office; compliance ₹25L a year after the round; brand ₹2L a month; 10% contingency on every cost	Agreed inputs and the agreed 10% contingency; per-saver tech and the ₹25L compliance are our estimates
Growth limit	At most 20% of about 7 crore urban self-employed ever signed	PLFS shares (agreed pool) and the agreed 20% cap
Not counted	Interest on cash; any own-book lending; revenue beyond these lines	Conservative by design

THE UPSIDE: $1B BY YEAR 5, AT OUR TARGETS

Upside, not the plan: at 2.5 lakh savers a month with every target holding, 3 of 5 cases clear $1B by year 5; the cheapest needs $7.2M

VALUE AT MONTH 60, ₹ CRORE: FIVE CASES AT 2.5 LAKH ONLINE SAVERS A MONTH, AND THE 10-CRORE PATH. $1B ONLY IF BOTH BARS CLEAR THE LINE

Our targets for every loan input (LTV/CAC 7.7×); five cases at 2.5 lakh online savers a month from month 30, and the 10-crore path at 12.4 lakh a month (30 crore segment, a third captured); 1 in 10 savers from the doorstep. Yardsticks: 20× the month-60 revenue run-rate; 0.45× money saved (a little below the ~0.5× a recent savings-app round paid on money invested). Sign-ups stop at 20% of a 7 crore pool in month 75.
