What one saver is worth

LTV/CAC in 10 pages: how one saver makes money, how each assumption changes the number, and what the odds mean for the company.

October 2026 · Confidential

₹495

to win one online saver: measured, held fixed (₹450 + our 10% contingency)

1.7×

LTV/CAC in the main case, the median of 1,000 draws; 23% of them reach 3×

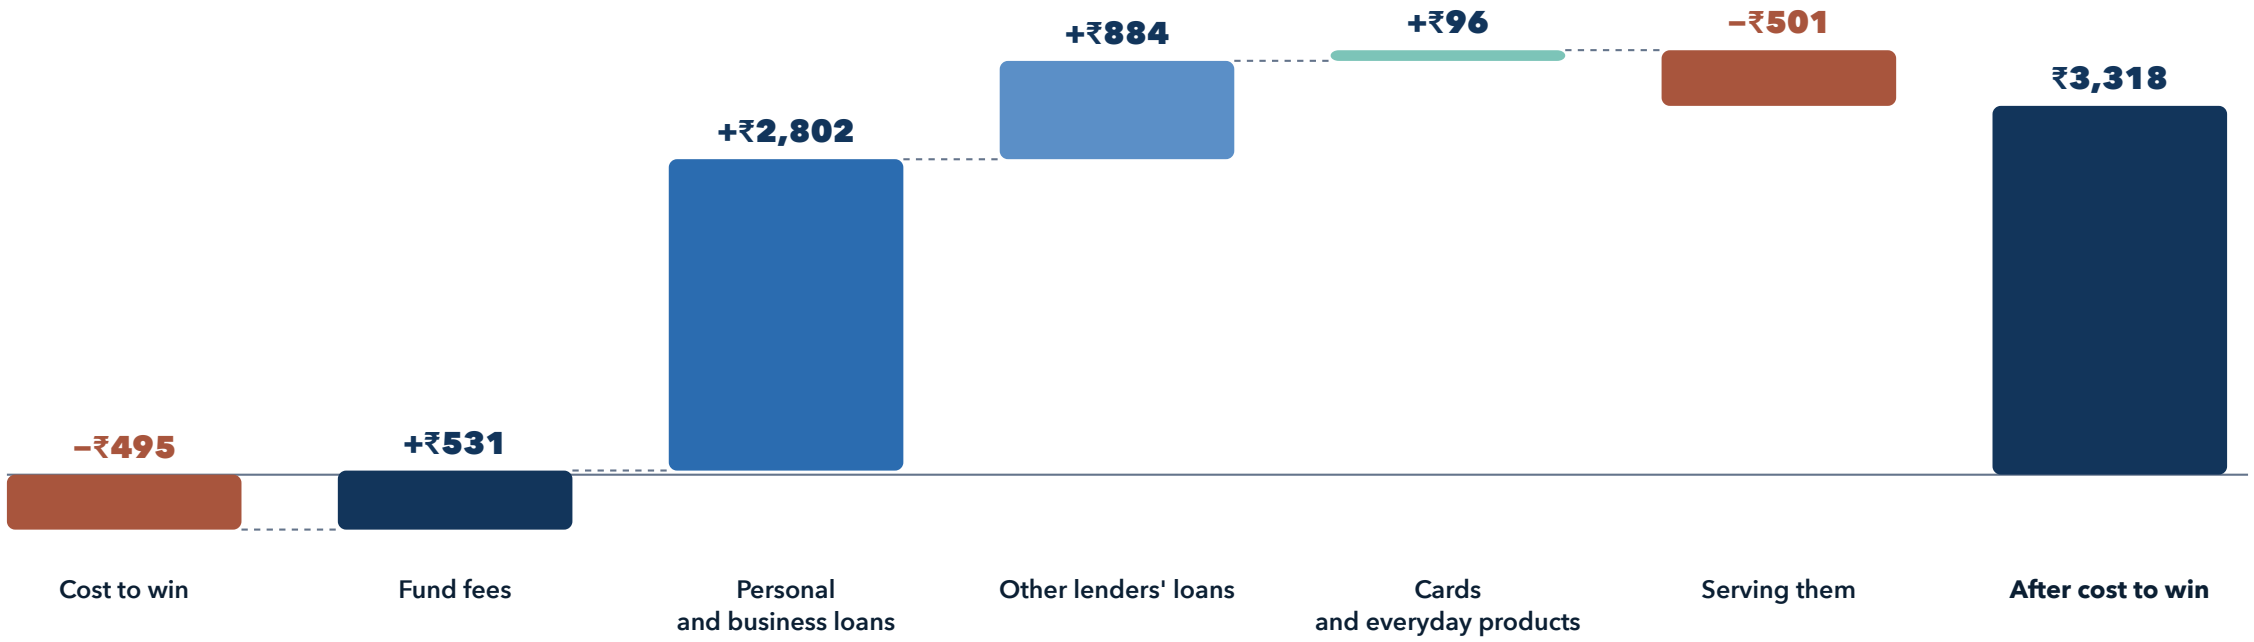

7.7×

our target, not the main case: every loan target holding, paid back in month 12

Loans are 85% of the money at our targets. With every input at today's market the same saver returns 0.4×. The seed's first job is to find out where between the two we are.

HOW ONE SAVER MAKES MONEY

At our targets, one online saver: ₹495 to win, ₹3,813 back in five years: 7.7×

Loans make the money
Lenders pay us a referral fee on every loan we bring: ₹3,686 of the ₹4,313 a saver brings in five years.

Saving pays its own way, just
Fund fees (₹531) about cover the cost of serving a saver (₹501): support, tech and payments.

7.7× is our target, not the main case
₹3,813 back (revenue less serving) on ₹495 to win if every target holds. With the unmeasured inputs drawn, the median is 1.7× (page 5).

One online saver won, months 1–60, undiscounted. Net after the cost to win = LTV less the cost to win.

WHERE THE LOAN MONEY COMES FROM

100 savers won bring 250 people who can see loan offers; 38 loans later, that is ₹2,802 a saver

100
savers won

→

250
KYC'd users see loan offers (each saver brings 5 sign-ups; half finish KYC)

→

35%
of them apply for a loan each year

→

30%
of first applications approved

→

38 loans
in five years, ₹3.0 lakh on average: ₹115 lakh lent by our partners

→

₹2,802
in fees per saver won (about 2.4% of each loan)

The three loan targets
35% apply a year, 30% approved, ₹3 lakh loans. Together they make ₹2,802 of the ₹3,813.

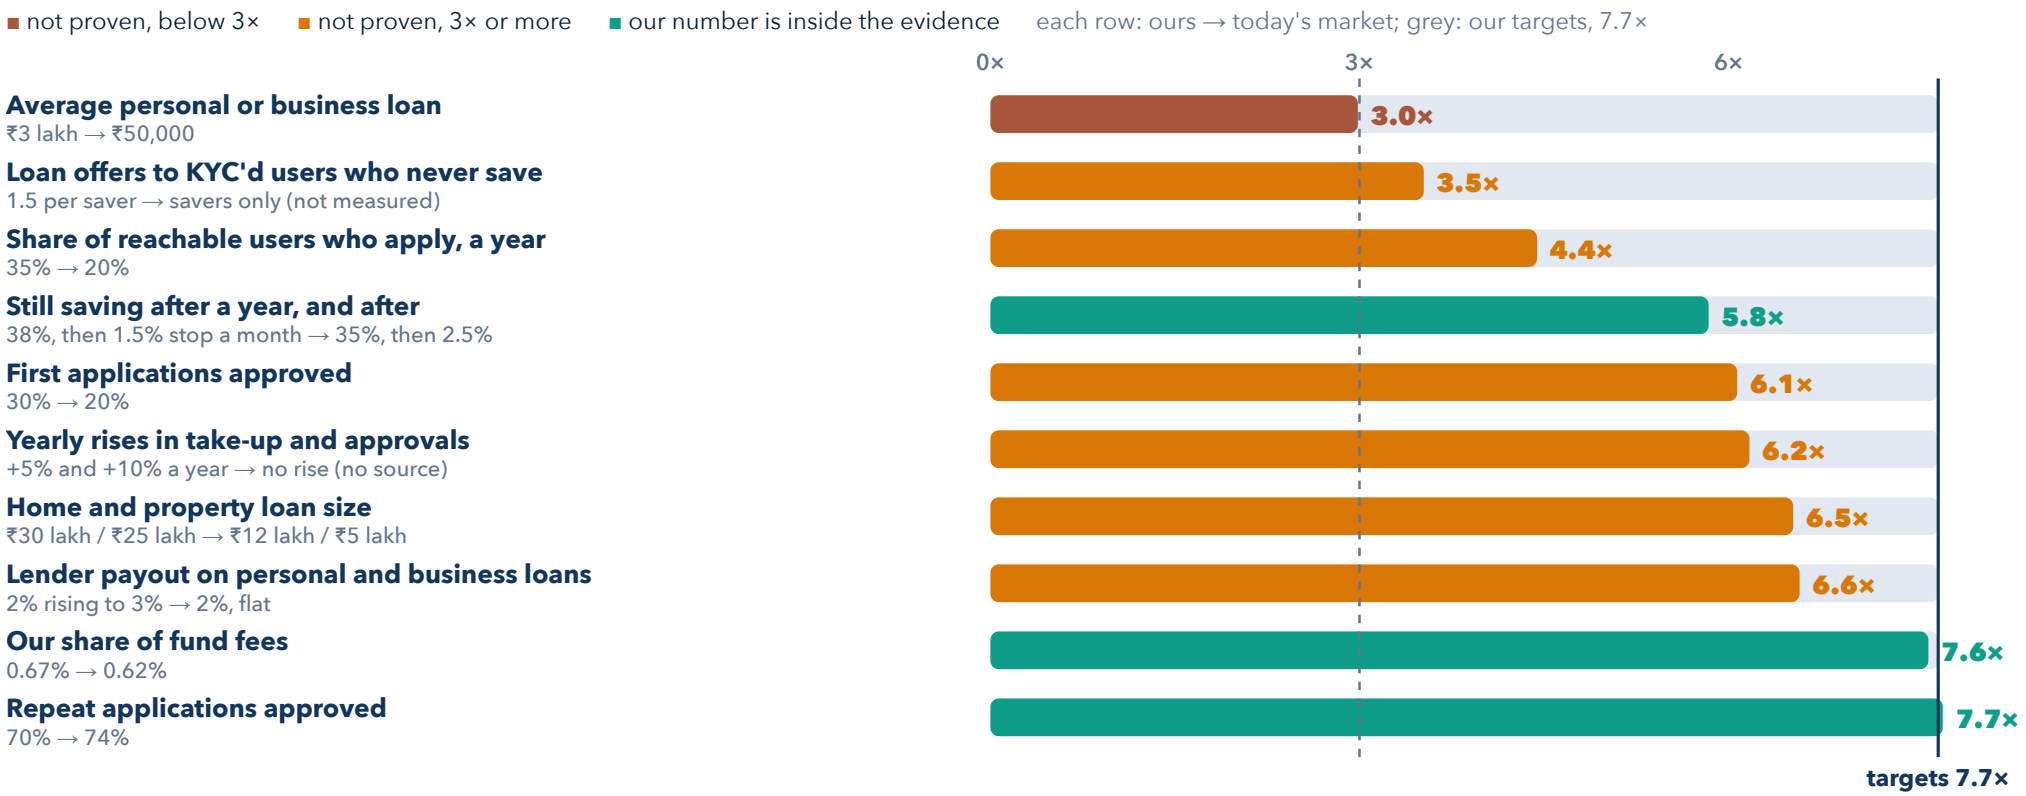

Other lenders' loans
Gold, property and home loans referred to other lenders add ₹884, most of it from a few large property and home loans.

Who pays
The lender, once, when the loan is paid out; part comes back if a loan closes or goes bad within six months. We never lend our own money.

Per 100 online savers won, first five years. Offers reach users while the saver who brought them keeps saving.

ONE AT A TIME

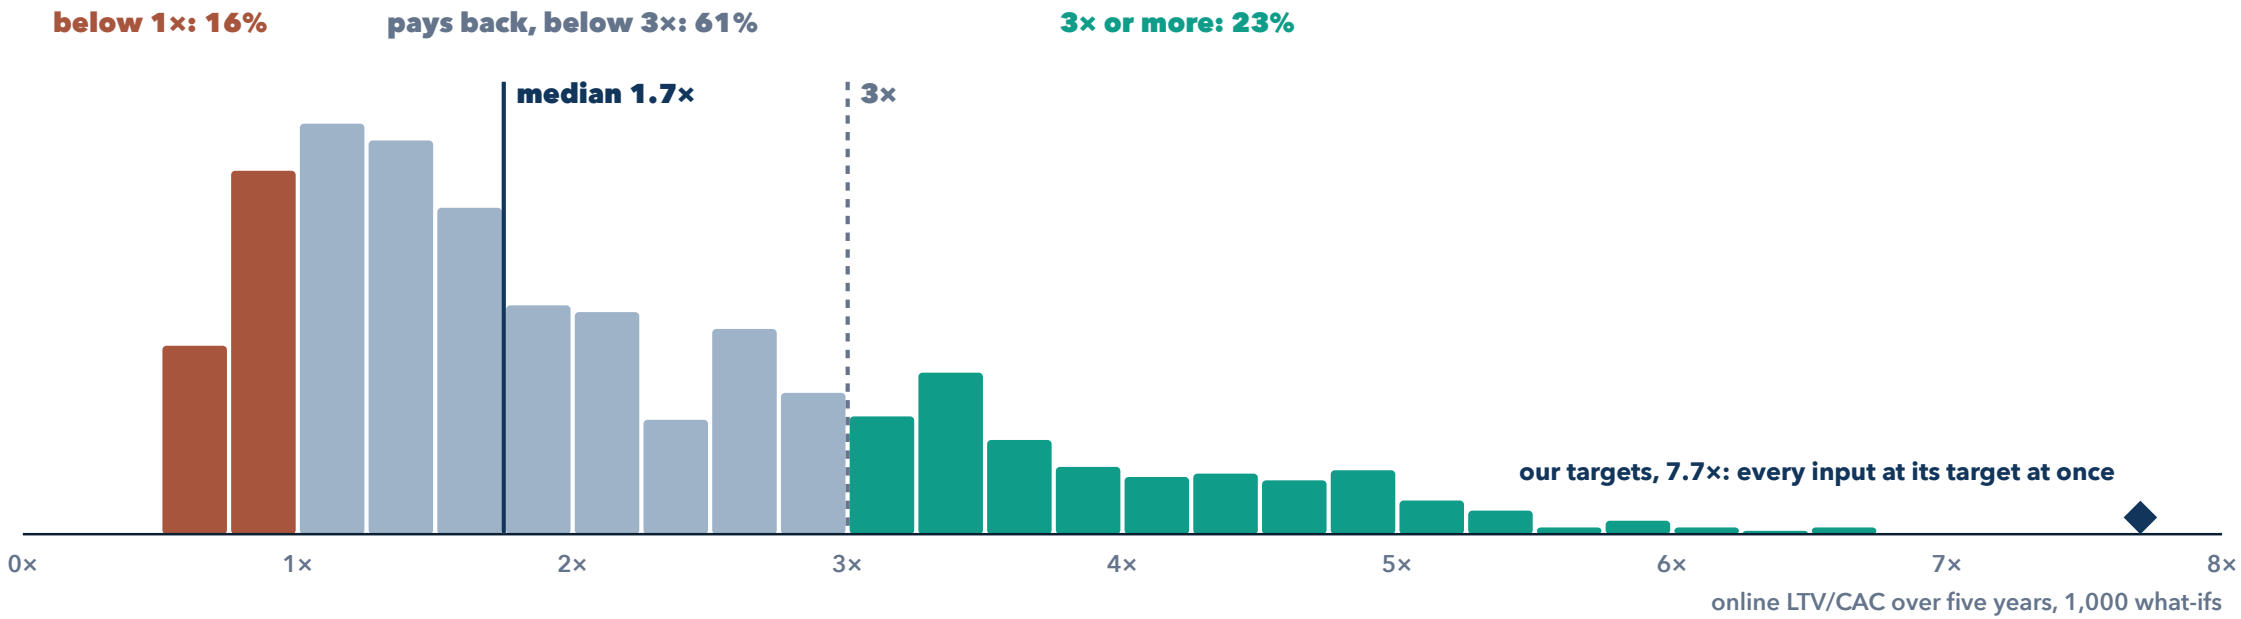

Change one assumption to today's market value and see the number: average personal or business loan moves it most, to 3.0×

Each bar: online LTV/CAC over five years with that one assumption at the market value and everything else at our targets. The cost to win is measured and held at ₹495. Market values: the middle of the 2024–26 evidence; sources on the last page.

THE ODDS

With the cost to win fixed at ₹495, the median saver returns 1.7×; 23% of the what-ifs reach 3× and 16% do not pay back in five years

Cost to win is known
₹600 in the seed and ₹450 after, measured on our own funnel, plus our 10% contingency. It is held fixed; only the value of a saver is drawn.

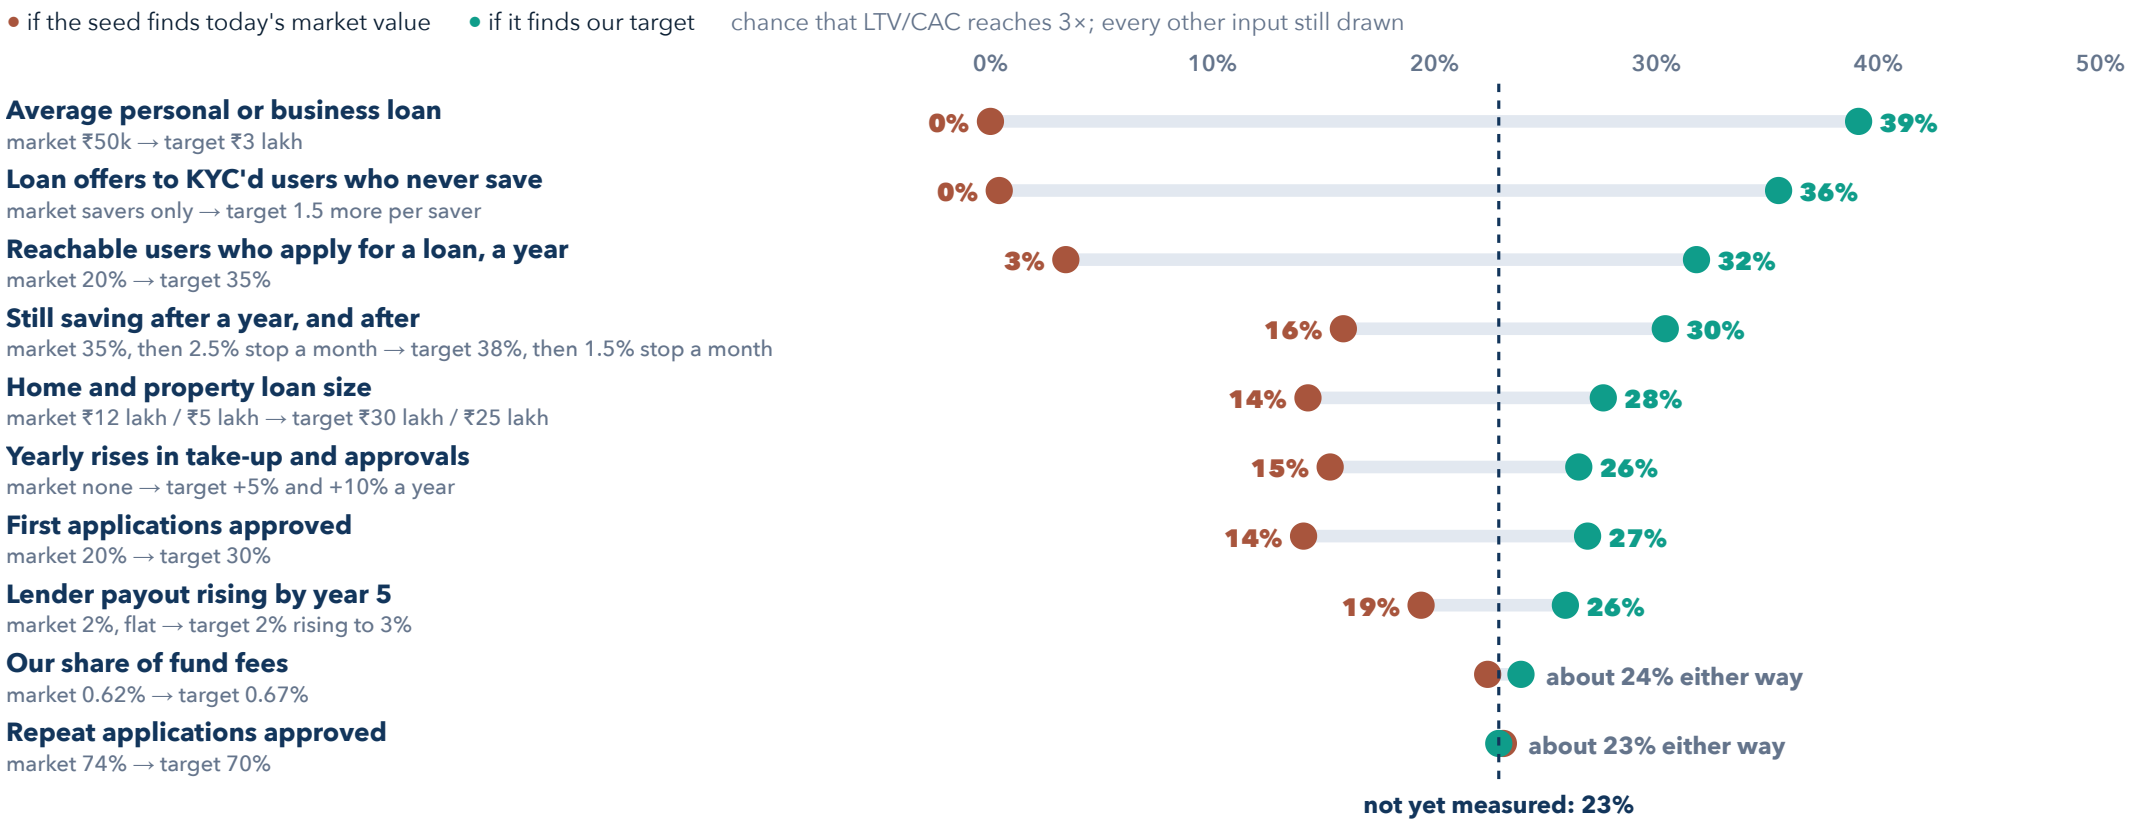

The value is not
Each of 10 unmeasured inputs is equally likely anywhere between today's market and our target. Loan inputs move together: savers who want credit apply more, borrow more and are approved more.

7.7× is the top corner
It needs every input at its target at the same time. None of the 1,000 what-ifs gets there; the best tenth reach 3.9× or more.

A Monte Carlo: 1,000 random what-ifs, the loan inputs moving together. Market values: the middle of the 2024–26 evidence. LTV/CAC: revenue less serving over 60 months, divided by the cost to win; undiscounted.

WHAT EACH MEASUREMENT IS WORTH

The average loan decides most: if it proves at ₹3 lakh the chance of 3× rises from 23% to 39%; at ₹50k it falls to 0%

The same 1,000 what-ifs with one input fixed at today's market value, then at our target. Inputs ranked by how much the median moves.

THE COMPANY AT EACH LTV/CAC

At the median 1.7× EBITDA turns positive in month 63 on $4.7M; at 3×, month 46 on $3.1M; at our targets, month 33 on $1.8M

LTV/CAC · CHANCE OF AT LEAST THIS	MONEY NEEDED IN ALL	EBITDA POSITIVE FROM	YEAR 5 EBITDA · 8-YEAR TOTAL
7.7× **our targets** every target at once	**$1.8M**	**month 33**	**₹68 Cr · ₹450 Cr**
5.0× chance 3%	**$2.3M**	**month 37**	**₹34 Cr · ₹231 Cr**
3.0× chance 23%	**$3.1M**	**month 46**	**₹10 Cr · ₹77 Cr**
2.0× chance 43%	**$4.2M**	**month 57**	**–₹1.2 Cr · ₹2.6 Cr**
1.7× **main case (median)** chance 50%	**$4.7M**	**month 63**	**–₹4.0 Cr · –₹15 Cr**
1.0× chance 84%	**$8.1M**	**not by year 8**	**–₹12 Cr · –₹67 Cr**
0.4× **today's market** every input at market	**$11.6M**	**not by year 8**	**–₹17 Cr · –₹102 Cr**

One plan, many outcomes
Every row is the same company: 20,000 online savers a month from month 30, the same team and the same cost to win. Only the value of a saver changes.

The main case
Every unmeasured input 48% of the way from today's market to our target gives the median, 1.7×. The financials are built on it.

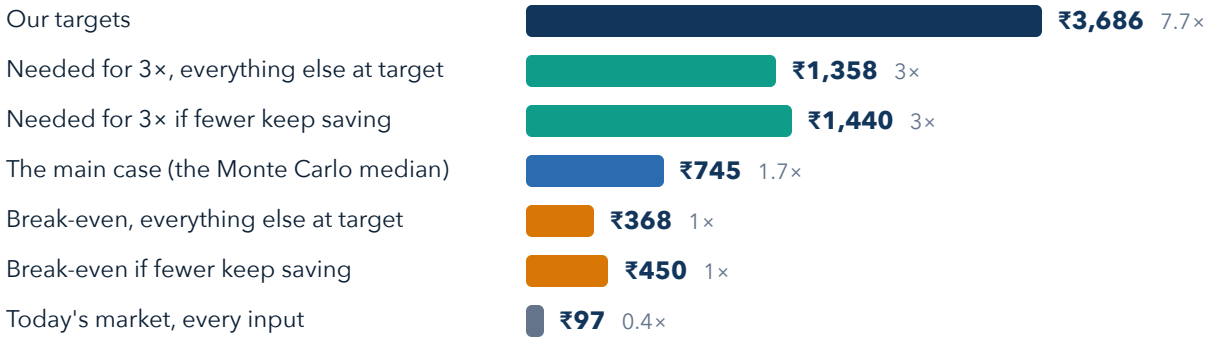

What the seed buys
Which row we are on. The next round (money needed less the $0.5M seed) is about $4.2M at the median and $2.6M at 3×.

Each row: every unmeasured input the same share of the way from today's market to our target, solved for that LTV/CAC, and every row still scales to 20,000 savers a month. EBITDA: operating profit before tax. Chance: share of the 1,000 what-ifs at or above it. Money needed: the deepest cumulative cash hole, seed included, plus a ₹5 crore floor. Doorstep savers (1 in 10) carry the same loan inputs. Undiscounted.

WHAT LENDERS MUST PAY US

What has to be true: lenders pay us ₹3,686 per saver won at our targets and ₹745 in the main case; 3× needs ₹1,358, break-even ₹368

LENDER FEES PER ONLINE SAVER WON, FIRST 5 YEARS (₹)

What that means in loans: personal and business loans per 100 savers won over five years, at each average loan size (other lenders' loans not counted, so these are the most needed). Our targets have 38 at ₹3 lakh.

AVERAGE LOAN	BREAK-EVEN	3×	3× IF FEWER KEEP SAVING
₹50k	30	112	119
₹1 lakh	15	56	59
₹3 lakh	5	19	20

Why this number

Lender fees are 85% of a saver's revenue at our targets. The cost to win is known, so this is the number that decides: below ₹1,358 per saver won, LTV/CAC falls under 3×.

Today's market

On the largest payments and lending apps, 1–5% of users take a loan in a year and first loans are ₹5,000–25,000. Nobody has measured savers who choose to see lender offers.

What the seed measures

Month by month: the share of KYC'd users who opt in to offers, first loans per 100, the median approved loan, and the fee lenders pay after clawbacks, in writing.

Lender fees per saver won: every loan referral fee from one online saver won and the KYC'd users who came with them, over five years, after payouts taken back. Cost to win ₹495 throughout (₹450 plus our 10% contingency). Fewer keep saving: 35% still saving at a year and 2.5% stopping each month after, the middle of the evidence. Main case: every unmeasured input 48% of the way from today's market to our target. Today's market: 20% of reachable users apply a year, 20% of first applications and 74% of repeats approved, no yearly rises, ₹50,000 personal and business loans, ₹12 lakh home and ₹5 lakh property loans, offers to savers only, a 2% payout with no rise, 0.62% of the fund as our fee, 35% still saving at a year and 2.5% stopping a month after.

FIVE CHECKS

Five checks tell us whether the bet holds, most of them before we spend on growth

1

A lender's pre-screen

A lending partner soft-checks the credit of our first 1,000 KYC'd sign-ups.

Pass: approval near 30%, eligible loans near ₹3 lakh

2

Terms in writing

The payout, clawbacks and approval rules for savers with 3–6 months of saving, signed.

Pass: a payout of 2% or more after clawbacks

3

Who signs up

The income of the first sign-ups; it sets the loan size more than anything we assume.

Pass: income of ₹40k+ a month for ₹3 lakh loans

4

Opt-in and apply

How many KYC'd users ask to see lender offers, and how many apply in 3 months.

Pass: 35% or more opting in

5

The real cost to win

What the pilot pays per saver who makes a first debit.

Pass: ₹600 or less in the seed, ₹450 after

Checks 1 and 2 need no money lent and take weeks. If they pass, 7.7× has evidence behind it. If they come back at market levels, we know before the money goes into scale, and we change the plan: bigger savers, a cheaper way to win them, or more per loan.

Pass marks are the plan's own targets. A soft credit check reads a bureau file without touching the person's score.

EVERY ASSUMPTION ON ONE PAGE

Our numbers against today's market, and what each does to the 7.7×

ASSUMPTION	OURS	TODAY'S MARKET	LTV/CAC AT MARKET	INSIDE THE EVIDENCE?	WHERE THE MARKET FIGURE COMES FROM
Average personal or business loan	₹3 lakh	₹50,000	**3.0×**	no	first loans ₹5,000–25,000; digital lenders ₹15,000–1.2 lakh (bureau, FACE)
Loan offers to KYC'd users who never save	1.5 per saver	savers only (not measured)	**3.5×**	no	not measured anywhere
Share of reachable users who apply, a year	35%	20%	**4.4×**	no	1–5% of app users borrow a year (Paytm, Kissht, PhonePe filings)
Still saving after a year, and after	38%, then 1.5% stop a month	35%, then 2.5%	**5.8×**	yes	24–45% at a year; 1–4% a month after
First applications approved	30%	20%	**6.1×**	no	11% of new applicants at an app lender (prospectus)
Yearly rises in take-up and approvals	+5% and +10% a year	no rise (no source)	**6.2×**	no	no source found
Home and property loan size	₹30 lakh / ₹25 lakh	₹12 lakh / ₹5 lakh	**6.5×**	no	mass-market lenders ₹10–15 lakh / ₹3–10 lakh
Lender payout on personal and business loans	2% rising to 3%	2%, flat	**6.6×**	no	rate cards 1–2.5%, flat
Our share of fund fees	0.67%	0.62%	**7.6×**	yes	0.50–0.88% equity, 0.08–0.50% debt
Repeat applications approved	70%	74%	**7.7×**	yes	74% of repeat customers at an app lender
