Save91 / SaveMore

Working name, to be finalised

What one saver is worth

LTV/CAC, assumption by assumption: the number, where it comes from, how far it could be wrong, and what that does.

October 2026 · Confidential

4.1×

one online saver: ₹450 to win, ₹1,845 back over five years after serving costs; paid back in month 19. At the seed's ₹600: 3.1×

3.8×

one doorstep saver: ₹404 to win all-in, ₹1,550 back; paid back in month 23

3.8× median

across 1,000 simulated futures (our own ranges, not observed odds): 77% at 3× or better, 1 in 10 below 2.6×

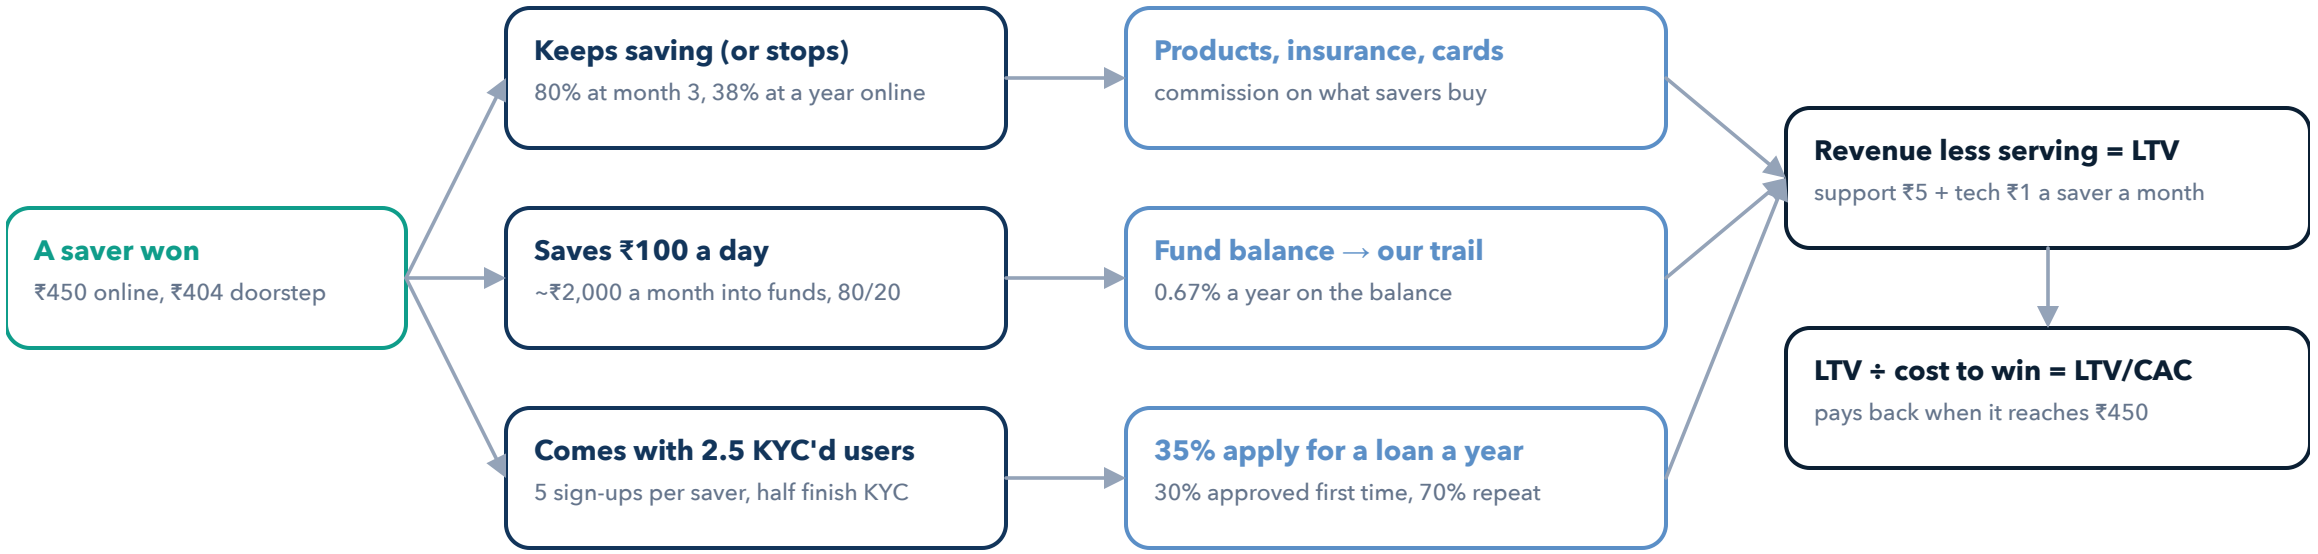

6 numbers

decide it: loan size, how many apply for a loan, the cost to win, the daily amount, the loan payout and how many keep saving. Each is shown with its source, range and effect.

The same model as the business plan, rebuilt in a live workbook cell by cell. The arithmetic is checked to the rupee; the assumptions are ours. Change one in the workbook and the per-saver answer moves live; the 1,000 futures are rerun on request.

THE DEFINITION

One saver's value is three streams (the fund, loans, other products) for as long as they keep saving, less serving, against the cost to win them

Saver won, not sign-up

A saver is someone who starts saving. Online, 1 in 5 sign-ups does; the cost to win is everything spent to get one saver.

Undiscounted, 5 years (8 alongside)

LTV = what a saver brings in less what it costs to serve them while they save. No discounting: the cumulative rupees.

The cautious saver

The answer is for a saver who joins early, before take-up and approvals have grown with the business's track record (they grow to year 5), at the post-seed ₹450 to win. Later savers are worth more.

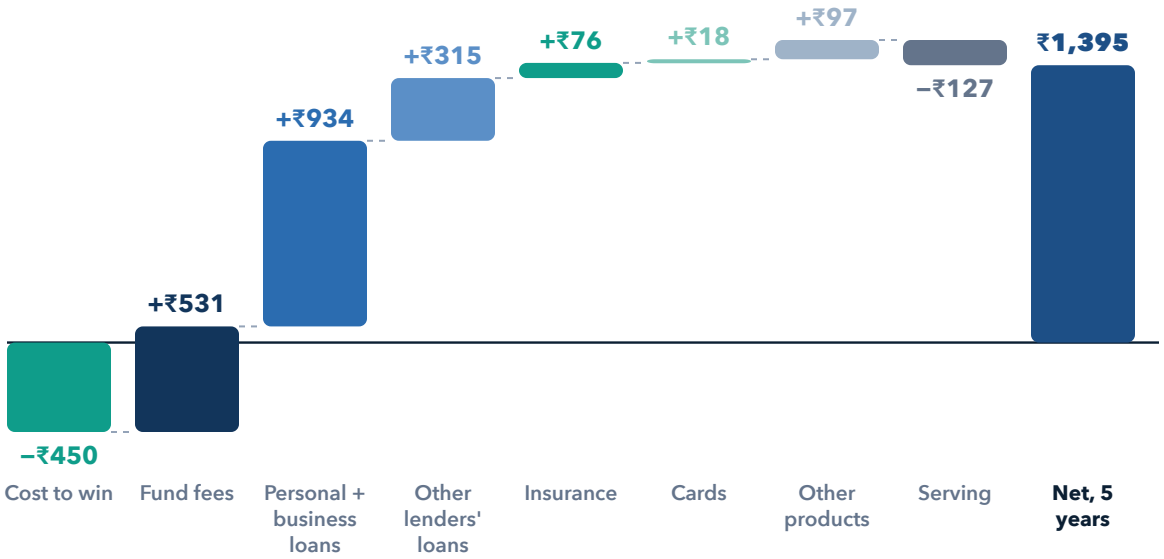

Words used here. KYC'd: finished the identity check. **Trail**: the yearly share of a fund's fee paid to its distributor. **SIP**: a regular instalment into a mutual fund. **NBFC**: a non-bank lender. **DSA**: an agent paid by a lender for referred loans. **EMI**: a loan instalment. **LAP**: a loan against property. **Doorstep**: a field agent signs the saver in person. **The seed**: the first 18 months. **Futures**: simulated draws of all inputs together.

Not in this view: the team, office and brand, the 10% contingency, the two-month wait for fees, tax. The app never holds the money; loans are made by banks and NBFCs.

LTV / CAC

An online saver costs ₹450 and returns ₹1,845 over five years: 4.1×, paid back in month 19; a doorstep saver 3.8×, month 23

ONE ONLINE SAVER WON, FIRST 5 YEARS (₹)

₹ PER SAVER WON	ONLINE, 5 YEARS	DOORSTEP, 5 YEARS	ONLINE, 8 YEARS	DOORSTEP, 8 YEARS
Cost to win	−₹450	−₹404	−₹450	−₹404
Fund fees	₹531	₹757	₹989	₹1,420

Net	**₹1,395**	**₹1,145**	**₹2,500**	**₹2,223**
LTV/CAC	**4.10×**	**3.83×**	**6.56×**	**6.50×**
Pays back	month 19	month 23	–	–

Loans are the biggest stream

₹1,249 of ₹1,972: 63% of revenue. Fund fees are 27%; insurance, cards and other products 10%.

Doorstep: more saving, fewer loans

More doorstep savers keep saving (55% vs 38% at a year), so the fund earns ₹757 vs ₹531; but a doorstep saver brings no extra KYC'd users.

Cross-sell is 73% of revenue

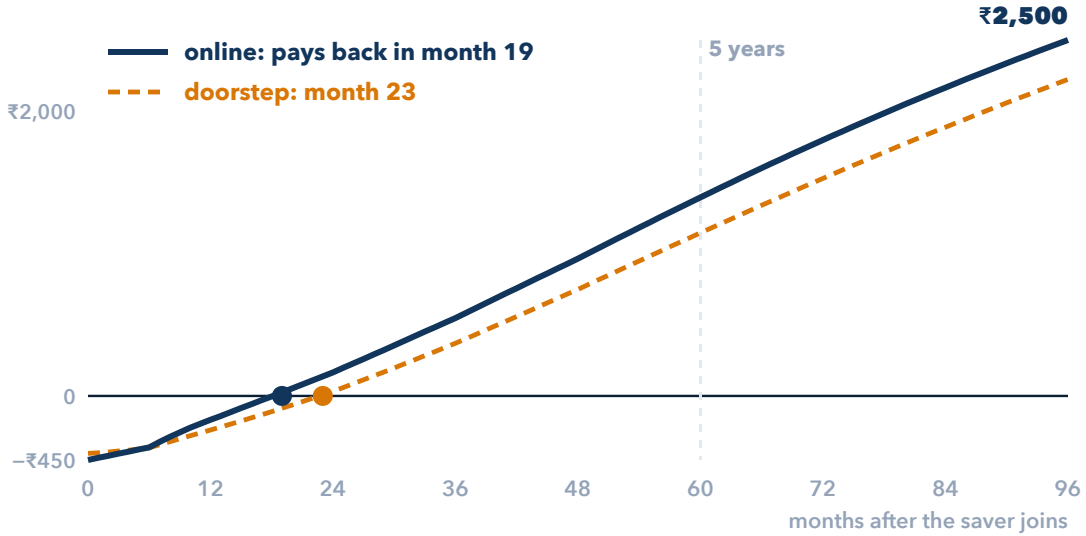

Everything except the fund trail is earned on what users borrow or buy through us. About ₹750 of the ₹1,845 comes from loans to KYC'd sign-ups who never save; with offers to savers only, LTV/CAC is 2.4×.

₹1,972 revenue − ₹127 serving = ₹1,845 returned; less ₹450 to win = ₹1,395 net. Live in the workbook, tab LTV-CAC. Rounded; rows may not add exactly.

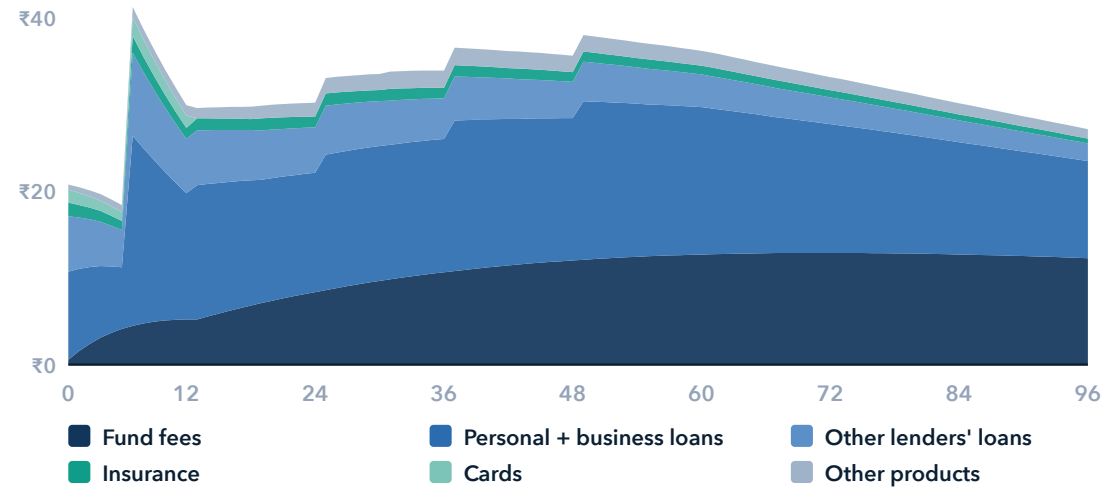

WHEN IT PAYS BACK

The online saver earns back the ₹450 in month 19; the doorstep saver in month 23; by year 8 each has returned about six and a half times its cost

CUMULATIVE ₹ PER SAVER WON, AFTER THE COST TO WIN

₹ A MONTH FROM ONE ONLINE SAVER WON, BY STREAM

Why month 19

Loans start in month 1 for every KYC'd user, at half the full take-up and 60% of the approvals for six months; a first loan pays 2% of ₹1 lakh. The fund trail builds slowly with the balance.

A jump in month 7

The first six months run at half the take-up and 60% of the approvals; from month 7 every user applies at the full rate, so first loans peak, then thin as users borrow once and savers stop.

Then a long tail

After year 1, 1.5% of savers stop each month; the fund balance, repeat borrowing and loan offers to KYC'd users who never saved keep paying: ₹1,105 more in years 6–8.

Left: cumulative revenue less serving, minus the cost to win (Saver tab, the last column of each saver). Right: the online saver's monthly revenue lines, stacked.

COST TO WIN A SAVER

We assume ₹450 to win an online saver after the seed (the seed is budgeted at ₹600); at ₹300 LTV/CAC is 6.2×, at ₹600 3.1×

THE SEED'S BUDGETED FUNNEL: WHAT A SAVER WON COSTS (₹)

5 sign-ups × ₹100
a sign-up, paid acquisition

₹500

1 in 5 sign-ups starts saving

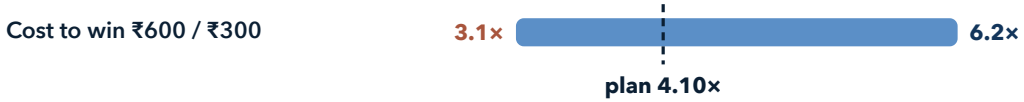

2.5 KYCs × ₹40
half the sign-ups finish KYC

₹100

₹450 after the seed needs
₹70 a sign-up, or
1 in 3.75 saving

₹600 in the seed

ONLINE LTV/CAC AT ₹300 AND ₹600 TO WIN

Paid back in month **13** at ₹300 and month **24** at ₹600 (plan: month 19).
The doorstep cost is worked out, not assumed: agents' pay, kit, leads, offices and churn divided by the savers they sign, ₹404 a saver at scale.

ASSUMPTION	VALUE	RANGE WE TEST	WHERE IT COMES FROM
Online saver: cost to win after the…	**₹450**	₹300 – ₹600	Founder's judgement; seed funnel budget ₹600
Doorstep saver: cost to win, all-in…	**₹404**	fixed	Our business-plan model, at scale

₹450 after the seed
₹600 is the seed funnel's budget (₹100 a sign-up, 1 in 5 saving), not yet a measurement. ₹450 is the founder's judgement for after the seed, once the brand is known and referrals start.

₹300 is not our number
A competitor quoted about ₹300 per 'customer', without saying whether a customer is a sign-up or a saver. We use it only as the good end.

The seed will measure it
Cost per sign-up, share finishing KYC and share starting to save are the first three numbers we plan to report from the seed, every month.

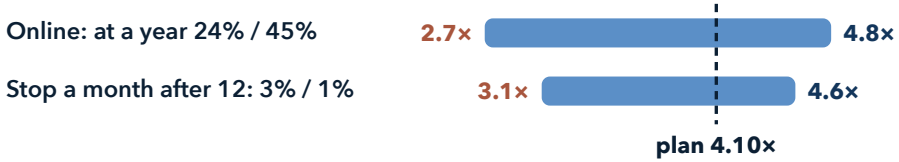

All-in: marketing, onboarding and KYC per saver won. Doorstep, at scale: agent salary, statutory costs, incentive and cash cover ₹26,000 a month; kit ₹12,000; 30% of agents leave a year.

WHO KEEPS SAVING

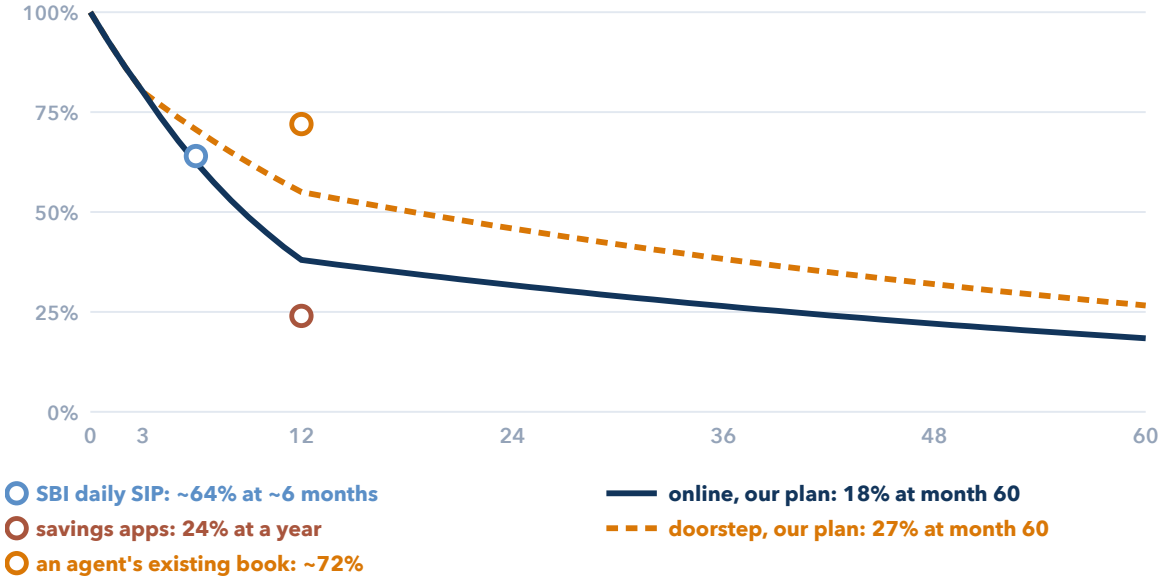

We assume 38 in 100 online savers are still saving after a year (doorstep 55); at 24 LTV/CAC falls to 2.7×, at 45 it rises to 4.8×

ASSUMPTION	VALUE	RANGE WE TEST	WHERE IT COMES FROM
Online: still saving at month 3	**80%**	52% – 85%	SBI MF daily SIP's steady drop (NG-033)
Online: still saving at month 12	**38%**	24% – 45%	SBI MF ₹250 daily SIP, extended to 12 months
Doorstep: still saving at month 3	**80%**	60% – 92%	Agent's existing book ~92% (IV-12)
Doorstep: still saving at month 12	**55%**	25% – 72%	Agreed; agent's book ~72% (IV-01, IV-12)
Both: share who stop each month after…	**1.5%**	1% – 3%	US micro-investing app ~1% (TB-11)

ONLINE LTV/CAC AT EACH END

SHARE OF SAVERS WON STILL SAVING, MONTHS 0-60

Doorstep at 25% / 72% still saving at a year: **1.8×** / **5.0×** (plan 3.8×).

38% is an extrapolation

SBI MF's ₹250 daily SIP lost 36% of a year's sign-ups within that year, at an average age of about six months; we extend the same monthly drop to month 12. Nobody has observed our product yet.

Why the doorstep keeps more

An agent visits every few days; an existing agent's book keeps about 72% a year. We plan 55% for new doorstep savers, between an app and an existing book.

After a year, few leave

Savers who last a year rarely stop: a US micro-investing app loses about 1% a month after month 12; an agent's book about 2.7%. We plan 1.5%.

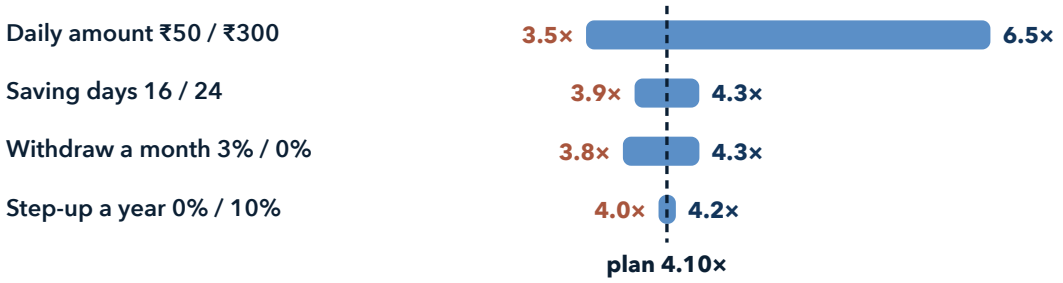

Monthly drop-off: steady within months 1–3 and within months 4–12 (so 80% at month 3 and 38% at month 12 online), then 1.5% a month for both.

HOW MUCH THEY SAVE

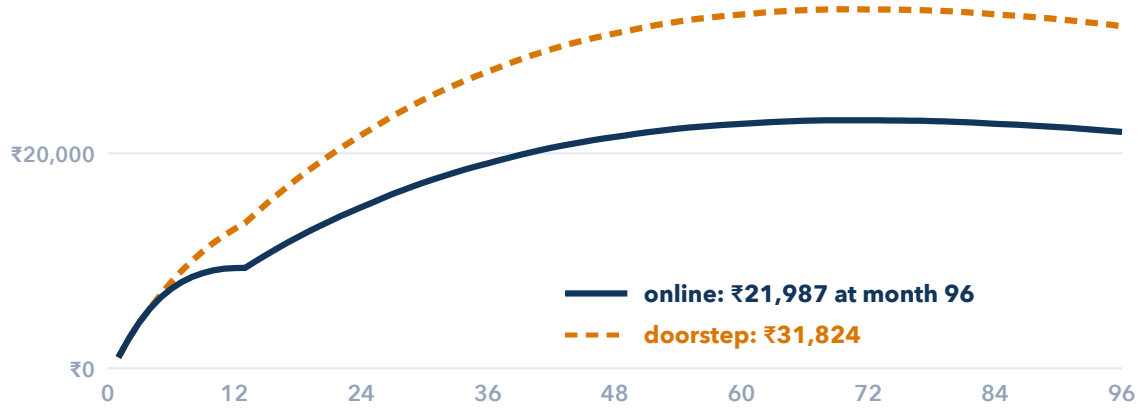

We assume ₹100 a day on about 20 days a month; at ₹50 LTV/CAC is 3.5×, at ₹300 it is 6.5×

ASSUMPTION	VALUE	RANGE WE TEST	WHERE IT COMES FROM
Daily amount	**₹100**	₹50 – ₹300	A daily-savings app's minimum
Saving days a month	**20**	16 – 24	Our judgement (a shop opens ~26 days)
Daily amount steps up each year saved	**5%**	0% – 10%	Our judgement; no data
Share of the balance withdrawn each…	**1%**	0% – 3%	Our judgement; no data
Share of the balance that stays at…	**100%**	fixed	Product design (an SIP runs on)

ONLINE LTV/CAC AT EACH END

FUND BALANCE PER SAVER WON (₹, AVERAGE IN THE MONTH)

₹100 a day: a typical starting amount

A leading daily-savings app's stated minimum is ₹100; daily SIPs start at ₹50; that app's own film shows ₹300. We test ₹50 to ₹300. On about 20 saving days, ₹100 is ₹2,000 a month.

₹45,411 saved in five years

per online saver won (counting those who stop). The balance earns our trail, so the daily amount moves LTV through the fund fees: 3.5× at ₹50, 6.5× at ₹300.

Money stays in

An SIP keeps running, so nothing is paid out at the year end; 1% of the balance is withdrawn each month for emergencies, and a saver who stops takes the balance.

Deposits step up 5% each year saved. Balance = last month's balance less withdrawals, plus this month's deposits, plus the fund's return on both.

THE FUND TRAIL

80% equity and 20% debt funds pay us 0.67% a year of the balance: ₹531 from an online saver over five years, 27% of revenue

ASSUMPTION	VALUE	RANGE WE TEST	WHERE IT COMES FROM
Equity share of the savings	**80%**	50% – 90%	Conversation with a daily-savings app
Equity fund return to the saver, net	**10%**	6% – 12%	Our estimate (conservative)
Debt fund return to the saver, net	**7%**	6% – 7.5%	Liquid funds 5–6% (OWN-02)
Our trail on equity funds	**0.75%**	0.5% – 0.9%	Listed distributor 0.88–0.91% (XO-08)
Our trail on debt funds	**0.35%**	0.2% – 0.5%	Fund guides 0.2–0.5% (XB-04)

ONLINE LTV/CAC AT EACH END

HOW THE FUND PAYS US

80% equity × 0.75% + 20% debt × 0.35%

trail commission, paid by the fund house on the balance

= 0.67% a year of the balance

₹531 over 5 years per online saver won

₹757 per doorstep saver (more keep saving)

Our own distributor licence (to be registered)

The one stream we plan to earn on our own registration, paid while the money stays invested, even after a saver stops adding.

Equity trail ~0.75%

A listed distributor earns ~0.9% of assets, gross; we use 0.75%. Apps selling direct plans earn nothing.

Returns matter little

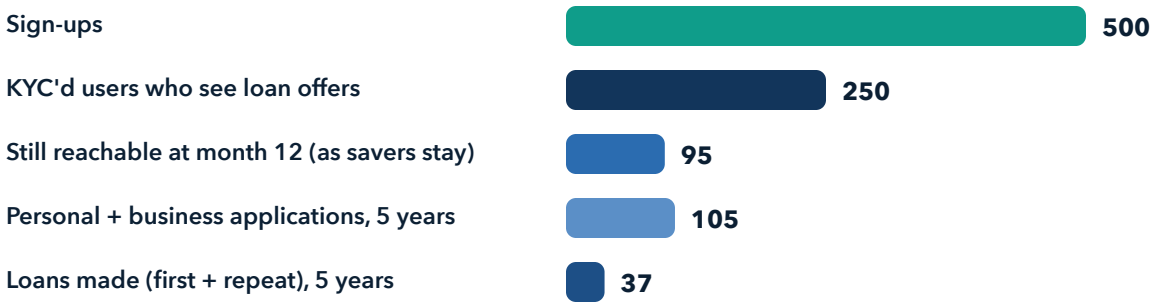

The fund's return only grows the balance the trail is paid on: 6% or 12% a year moves LTV/CAC by less than 0.1×.

Equity SIP trail 0.5–0.9% (a listed distributor's 0.88–0.91%); debt fund 0.2–0.5% (fund and adviser guides). Debt-only savers would earn the lower trail.

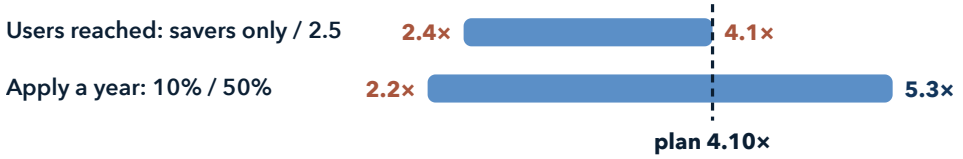

LOANS: WHO SEES THE OFFERS, WHO APPLIES

We assume loan offers reach 2.5 KYC'd users per online saver and 35% apply a year; offers to savers only give 2.4×, 10% applying gives 2.2×

PER 100 ONLINE SAVERS WON

ONLINE LTV/CAC AT EACH END

ASSUMPTION	VALUE	RANGE WE TEST	WHERE IT COMES FROM
Online: KYC'd users who see loan…	**2.5**	1 – 2.5	5 sign-ups a saver, half finish KYC
Reachable users who apply for a loan…	**35%**	10% – 50%	Founder's judgement; no observed rate
Share of applications: personal or…	**70%**	fixed	Founder's judgement (XF rows)
Share of applications: gold loans	**15%**	fixed	Founder's judgement (XF rows)
Share of applications: loans against…	**3%**	fixed	Founder's judgement (XF rows)
Share of applications: home loans	**2%**	fixed	Founder's judgement (XF rows)

Paid back in month **31** if offers go to savers only, month **34** if only 10% apply, month **14** if half do (plan: month 19).
The apply rate is the plan's most fragile number: across the 1,000 futures it moves LTV/CAC more than any other input (rank correlation 0.41). The nearest observed rate is 1–2% a year, among merchants on a payments app; at 2%, LTV/CAC would be **1.6×**, paid back in month **43**.
Rules on digital lending and on referral payouts could also change what lenders pay.

Anyone KYC'd, from day 1
Every sign-up who finishes KYC sees loan offers, saver or not: 2.5 per saver won. One who never saves stays reachable as long as savers do.

35% apply a year
The founders' judgement for a credit-hungry segment; about half of fintech borrowers take a new loan within six months. Payments-app merchants: 1–2% a year.

Split by loan type
70% personal or business, 15% gold, 3% against property, 2% home; the 10% against the saver's own savings is not counted.

Doorstep savers: 1 user reached per saver won. Applications use the same monthly chance for every reachable user while they remain.

PERSONAL AND BUSINESS LOANS

Personal and business loans bring ₹934 per online saver: 38 loans per 100 savers won over five years, at a 2% payout on ₹1 lakh

PER 100 ONLINE SAVERS WON, FIRST 5 YEARS

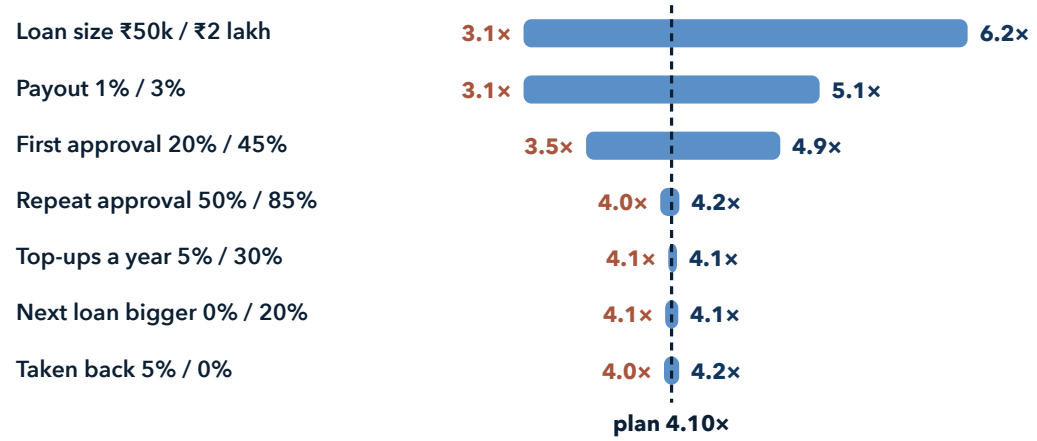

32 first loans **+ 5 repeat loans** **+ 1 top-up = 38**

about ₹38 lakh lent by banks and NBFCs

× 2% payout rising to 3% by month 60, less 2.5% of payouts taken back

= ₹934 per saver won 47% of 5-year revenue

ONLINE LTV/CAC AT EACH END

ASSUMPTION	VALUE	RANGE WE TEST	WHERE IT COMES FROM
First applications a lender approves	**30%**	20% – 45%	Founders' past data ~25% (XF-24)
Repeat applications approved (after…	**70%**	50% – 85%	Listed lender: 74% of repeat (XL-41)
Loan size, blended personal and…	**₹1 lakh**	₹50k – ₹2 lakh	Digital loans ₹19k–70k (XF-11)
Our DSA payout at the start	**2%**	1% – 3%	DSA rate cards 1–2.5% (XF-01)
Loan tenure	**18**	fixed	Research: 12-24 months
Borrowers with 12+ EMIs paid who take…	**15%**	5% – 30%	Our judgement; lenders top up good payers

30% first, 70% repeat

A digital lender approves 11% of new and 74% of repeat applicants; the founders' past lending about 25%. Our 30% sits above both; it rises 10% a year (cap 80%).

₹1 lakh, blended

Digital personal loans average ₹19,000–70,000; merchant loans ₹50,000–5 lakh (one app's average ₹2 lakh). ₹1 lakh sits above the personal-loan average: at ₹50,000 LTV/CAC is 3.1×.

A DSA's payout

Platforms pay DSAs 1–2.5% of a personal loan, up to 3%; we start at 2%, rising to 3% by year 5. Paid by the lender, who takes back 2.5% of payouts (loans cancelled or repaid early).

Tenure 18 months; a borrower can borrow again once repaid; top-ups after 12 EMIs paid. We earn a referral payout only: the lender carries the credit risk.

OTHER LENDERS' LOANS

Gold, property, home, durable and vehicle loans from other lenders add ₹315 per online saver; gold loans are a third of it

LOAN	APPLY A YEAR	APPROVAL	LOAN SIZE	OUR FEE	LOANS PER 100 SAVERS, 5 Y	₹ PER SAVER WON, 5 Y
Gold	5.25%	lender's call	₹1,00,000	0.5%	20.4	**₹102**
Loan against property	1.05%	45% approved	₹4,00,000	1%	2.2	**₹90**
Home	0.7%	45% approved	₹8,00,000	0.5%	1.5	**₹60**
Consumer durable	2%	lender's call	₹20,000	2%	8.2	**₹33**
Two-wheeler / e-rickshaw	0.5%	lender's call	₹1,50,000	1%	2.1	**₹31**
All other lenders' loans						**₹315**

ONLINE LTV/CAC AT EACH END

Gold: the most common
Gold loans average ₹1.96 lakh across India; we plan ₹1 lakh for this segment at a 0.5% payout (DSA rates 0.25–1.5%).

Property and home: rare but large
Micro-LAP averages ₹3.9 lakh, affordable housing ₹6–8 lakh; DSA payouts 0.5–1.5% and 0.25–0.75%. Secured, so approval is higher: 45%.

Durables and vehicles: small
We have no outside data on take-up or payout for these two; both are our assumptions and together worth about ₹64 a saver.

Apply a year for gold, property and home = 35% × that type's share of applications (our assumption). Each type: a monthly chance among users who have not yet bought one; one referral fee, on disbursal; every KYC'd user reached. Rounded; rows may not add exactly.

INSURANCE, CARDS AND OTHER PRODUCTS

Insurance, cards and everyday products add ₹192 per online saver over five years; no single one moves LTV/CAC by more than 0.2×

PRODUCT	TAKE-UP A YEAR	TICKET	OUR COMMISSION	RENEWS	₹ PER SAVER WON, 5 Y
Small health / hospital cash	6%	₹800	14%	50%	₹9
Family health cover	2%	₹8,000	14%	75%	₹36
Term life (small cover)	3%	₹1,000	20%	75%	₹10
Personal accident	5%	₹250	14%	50%	₹2
Two-wheeler insurance	15%	₹1,000	4.75%	70%	₹13
Mobile / device insurance	3%	₹500	13%	once	₹2
Shop insurance (fire and burglary)	3%	₹700	14%	65%	₹4
Choti SIP incentive	9%	–	₹500 at month 24	25%	₹7
NPS	3%	–	₹200 once	once	₹10
Digital gold	8%	₹300 a month	2.4%	65%	₹12
FD via partner banks	10%	₹10,000	0.5%	once	₹7
Mobile recharge	25%	₹2,600 a year	2%	100%	₹32
Bill payments	25%	24 bills a year	₹2 a bill	100%	₹29
Cards (once per saver)	3%	–	₹1,000 a card	once	₹18
All of these					**₹192**

Small on purpose: 10% of revenue

Insurance, cards and everyday products are where we expect to earn on top; we count them cautiously and the plan does not depend on them.

Insurance through a partner (to be signed)

We plan to sell under a broker partner's licence; the partner would keep a quarter, so we would get 75% of commissions, capped by the regulator's draft (15% first year, 5% on renewals).

Widest ranges, smallest effect

Every one of these products moves LTV/CAC by 0.2× or less across its whole range (family health cover is the largest: 4.0× to 4.2×).

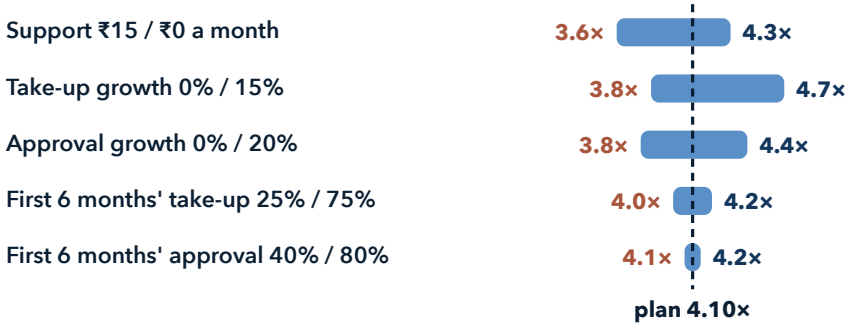

Take-up: share of savers still saving who do not yet hold it, a year. Policies renew each year at the rate shown; habits (gold, recharge, bills) keep running. Money counted while the saver keeps saving. Rounded; rows may not add exactly.

COST TO SERVE, AND THE FIRST MONTHS

Serving costs ₹6 a month per saver still saving (a total of ₹16 gives 3.6×); the slow first months and a growing track record move LTV/CAC by under 1×

ASSUMPTION	VALUE	RANGE WE TEST	WHERE IT COMES FROM
Support cost per saver still saving	**₹5**	₹0 – ₹15	Founder's figure
Tech cost per saver still saving	**₹1**	fixed	Our judgement
Months 1–6: take-up of every product,…	**50%**	25% – 75%	Founder's judgement
Months 1–6: loan and card approvals,…	**60%**	40% – 80%	New vs repeat approval gap (XL-41)
Take-up of every product rises each…	**5%**	0% – 15%	Our judgement; no data
Approvals rise each business year…	**10%**	0% – 20%	Our judgement (lenders see repayments)
Growth with the business's track…	**5**	fixed	Model rule

ONLINE LTV/CAC AT EACH END

Serving ₹127 over 5 years

₹5 a month for support, the app, bank charges and supervision, plus ₹1 of tech, for each saver still saving. Sign-ups who never save cost nothing to serve here (an assumption); compliance and lender integration are company costs, outside this view.

Slow first months

A saver of a few weeks is not ready to buy: in months 1–6 every product's take-up is half the full rate and lenders approve 60% as many, because the saving record is thin.

History helps, but only to year 5

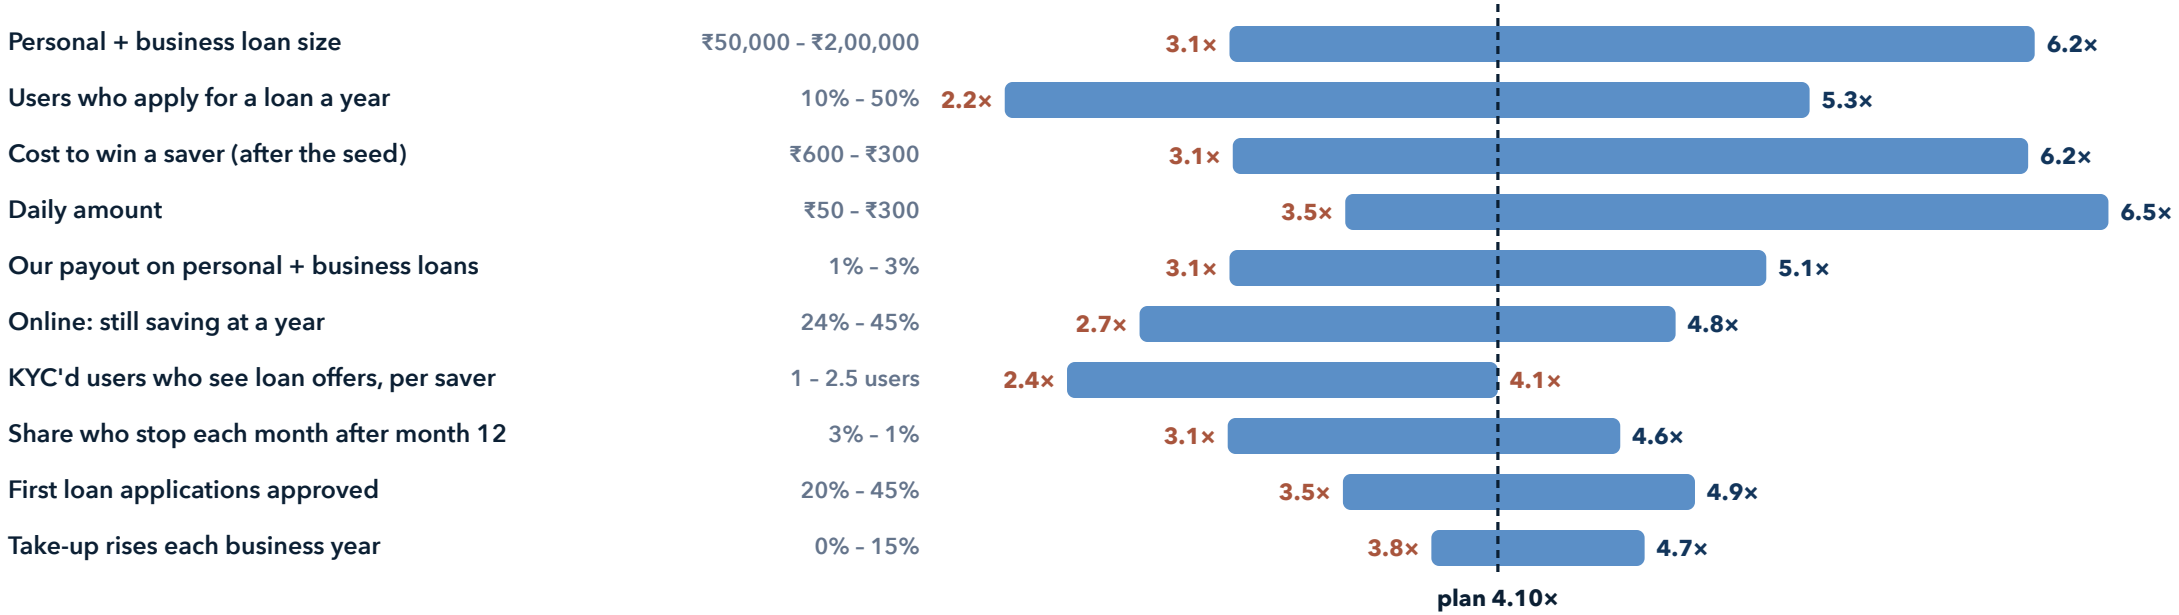

Each year the business runs, take-up rises 5% and approvals 10% (lenders see repayments); both stop rising after year 5. A saver who joins later starts higher.

Caps: no take-up above 2× the agreed rate, no first-loan approval above 80%.

ONE INPUT AT A TIME

Six inputs each move LTV/CAC by two turns or more (the cost to win: 3.1× to 6.2×); no other input moves it by two

ONLINE LTV/CAC (5 YEARS) WITH EACH INPUT AT THE LOW AND HIGH END OF ITS RANGE, EVERYTHING ELSE AT THE PLAN

Six inputs lead

Loan size, how many apply, the cost to win and the daily amount each move LTV/CAC by about 3 turns across their ranges; the payout and how many keep saving by about 2.

Retention matters, but less than feared

Still saving at a year (24–45%) moves LTV/CAC by about 2 turns: KYC'd users who never save still see loan offers, so revenue does not fall as fast as savers do.

76 of the other 84 inputs barely matter

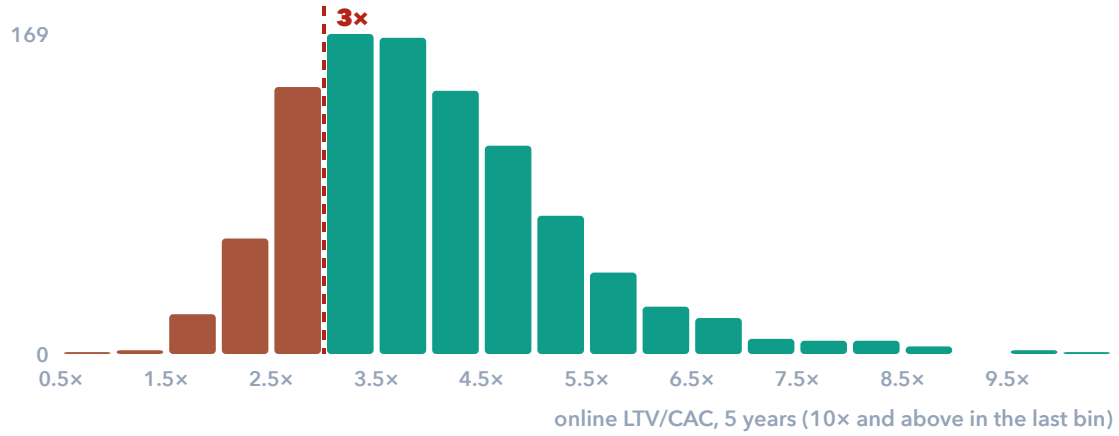

Each moves LTV/CAC by under 0.2×; every insurance, product and card assumption is among them (family health cover is the largest, 0.17×). The full list is on the workbook's 'What moves it' tab.

Each bar: the input at each end of its tested range, every other input at the plan; the range reads in the bar's order, left to right. Online saver, first five years.

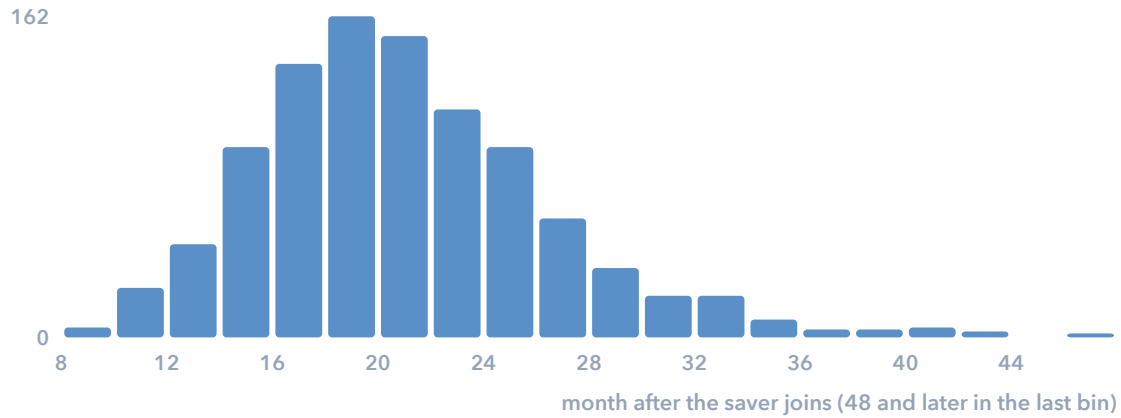

MONTE CARLO · OUR OWN RANGES, NOT OBSERVED ODDS: A STRESS TEST, NOT A FORECAST

Across 1,000 simulated futures the online saver's median LTV/CAC is 3.8×; 77% of futures reach 3×, and 1 in 10 falls below 2.6×

ONLINE LTV/CAC, 5 YEARS: FUTURES PER BIN, OF 1,000

ONLINE: MONTH THE SAVER PAYS BACK, FUTURES PER BIN

	10TH PERCENTILE	MEDIAN	90TH PERCENTILE	SHARE AT 3× OR MORE
Online LTV/CAC, 5 years	2.6×	3.8×	5.7×	77%
Online LTV/CAC, 8 years	3.9×	6.0×	9.2×	98%
Online pays back in month	14	20	28	79% by month 24
Doorstep LTV/CAC, 5 years	2.4×	3.8×	5.9×	76%
Doorstep pays back in month	17	23	30	63% by month 24

94 inputs drawn at once from their ranges (Latin hypercube, the same 1,000 futures as the company Monte Carlo; approvals and losses move together in bad years). The cost to win is drawn from ₹300 to ₹600, so no future is worse than the seed's budget. The plan (4.1×) sits above the median because the ranges are wider on the downside. Red bars: below 3×.

THE TESTS THAT MATTER

The loan funnel decides it: below 20% applying, the median LTV/CAC is 2.6× (1.6× at 2%); futures under 3× push company profit from month 40 to 49

IN FUTURES WHERE…	SHARE OF FUTURES	MEDIAN ONLINE LTV/CAC	MEDIAN PAYBACK MONTH
Fewer than 20% apply for a loan a year	4%	2.6×	28
Fewer than 30 in 100 still saving at a year	5%	3.1×	22
Cost to win above ₹525	10%	3.2×	23
All 1,000 futures	100%	3.8×	20
Only 2% apply (the nearest observed rate), all else at the plan	one test	1.6×	43

SAME FUTURES, THE WHOLE COMPANY (PROFITABLE PATH)	SHARE	MEDIAN PROFIT MONTH	MEDIAN MONEY NEEDED
Online LTV/CAC under 3×	23%	49	$3.3M
Online LTV/CAC 3× or more	77%	40	$2.4M

Where 3× holds, one input at a time (everything else at the plan):
· at least 21% apply for a loan a year (plan 35%)
· a cost to win of at most ₹615 (plan ₹450)
· at least 27 in 100 still saving at a year (plan 38)
· loans of at least ₹47,000 (plan ₹1 lakh)
· a payout of at least 0.94% (plan 2%)
· offers reaching at least 1.5 users per saver (plan 2.5)
The daily amount alone cannot break it: ₹50 a day still gives 3.5×.

Rules on digital lending and on referral payouts could change what lenders pay; the payout line is the one to watch.

Test the loan funnel first
How many KYC'd users apply, and how many are approved, is the least-observed and most powerful number. We plan to measure both with the seed's first lending partner.

Then retention and the cost to win
We plan to measure both from the first cohort: cost per saver won each month, and the share still saving at months 3, 6 and 12.

Ask the workbook
Every line here is a live question on the workbook's Projector tab; it filters the 1,000 futures by any input and reports any result.

Company: the profitable path, 20,000 online savers won a month from month 30. Money needed: the peak cash spent before profit, in $ at ₹95. Same 1,000 futures as the LTV/CAC, so each row is one consistent future.

HOW TO CHECK ANY NUMBER HERE

Every number in this deck is a cell in the LTV/CAC workbook: change an assumption and the per-saver answer moves live

TAB	WHAT IT HOLDS
LTV-CAC	The answer, live: waterfall, LTV/CAC over 5 and 8 years, payback, for both savers; the 1,000 futures' summary; next to the plan model's values (gap 0).
Projector	Ask the 1,000 futures anything: any result, any percentile, the share above a line, with up to three filters on any input.
Inputs	121 assumptions (94 drawn in the Monte Carlo, 27 fixed), each with its value, unit, range, source and reason; 20 worked-out values in grey.
Saver	One saver won, months 1–96, online and doorstep: still saving, deposits, balance, each revenue line, serving, cumulative after the cost to win.
Engine, Products	The month-by-month machinery: the fund, first, repeat and top-up loans, cards, and 19 products with their renewals.
Monte Carlo, What moves it, Sources	The 1,000 futures (values), every input one at a time with rank correlations, and the research behind each source ID.

Checked to the rupee

Every formula was replayed by an independent formula engine and matches the plan's model at the plan and at five Monte Carlo futures spread from 1.9× to 7.6×: LTV/CAC to six decimals, the payback month exactly.

Live where it matters

The one-saver model is about 13,000 live formulas: change ₹100 a day to ₹300 and LTV/CAC moves from 4.10× to 6.46× in the sheet. The 1,000 futures and the one-at-a-time tests are values, rerun on request.

Shareable

The workbook: docs.google.com/spreadsheets/d/1VdZy4vSSaTQmrp--txW31fjN8nHlF2iLQnLsUeAKTP4

Blue cells are assumptions; grey cells are worked out. The arithmetic is checked; the assumptions are ours. The Monte Carlo and one-at-a-time tests are rerun on request when assumptions change.

APPENDIX

Every assumption, every product, every source

A1–A6 every input with its range, source and effect · A7 every product's money · A8–A10 the sources · A11 how the model works.

A11 · HOW THE MODEL WORKS

The month-by-month rules behind one saver's value

STEP	HOW IT IS WORKED OUT, EVERY MONTH
Who keeps saving	A steady monthly drop-off within months 1–3, another within months 4–12 (set by the share at month 3 and at month 12), then 1.5% a month.
The fund	Balance = last month's balance less 1% withdrawn, plus deposits, plus the blended return on both. Our trail = average balance × 0.67% ÷ 12.
Loans	Each reachable user is in one of three states: never borrowed, repaid and able to borrow again, or repaying. Each month a share applies (35% a year spread over 12 months, × the take-up factor); approved first loans move to repaying; 18 months later they can borrow again.
Top-ups	Borrowers with 12+ EMIs paid and EMIs still due: 15% a year take a top-up of 40% of the original loan, at most one per loan.
Payouts	Money lent × the payout (2% rising in a straight line to 3% by month 60) × (1 − 2.5% taken back). Counted for 2.5 KYC'd users per online saver.
Products	For each product, the share not yet holding it buys at a monthly rate (the yearly take-up spread over 12 months × the take-up factor). Policies renew yearly at their renewal rate; habits keep running; insurance pays the partner's share.
Factors	Take-up factor: 50% in months 1–6, then 100%, × 1.05 per business year to year 5 (cap 2×). First-loan approval: 30% × 60% in months 1–6 × 1.10 per year (cap 80%).
Serving and payback	Serving = (₹5 + ₹1) × share still saving. Cumulative = −cost to win + Σ(revenue − serving); pays back in the first month it reaches zero.

These are the rules on the workbook's Engine, Products and Saver tabs, one column each.
